Package ‘rerddap’

July 20, 2019

Title  General Purpose Client for ‘ERDDAP’ Servers

Description  General purpose R client for ‘ERDDAP’ servers. Includes
functions to search for ‘datasets’, get summary information on
‘datasets’, and fetch ‘datasets’, in either ‘csv’ or ‘netCDF’ format.
‘ERDDAP’ information:

**rerddap-package**  General purpose R client for ERDDAP servers

## Description

General purpose R client for ERDDAP servers

## ERDDAP info

NOAA’s ERDDAP service holds many datasets of interest. It’s built on top of OPeNDAP [http://www.opendap.org/](http://www.opendap.org/). You can search for datasets via `ed_search()`, list datasets via `ed_datasets()`, get information on a single dataset via `info()`, then get data you want for either tabledap type via `tabledap()`, or for griddap type via `griddap()`
tabledap/griddap

tabledap and griddap have different interfaces to query for data, so \texttt{tabledap()} and \texttt{griddap()} are separated out as separate functions even though some of the internals are the same. In particular, with tabledap you can query on/subset all variables, whereas with griddap, you can only query on/subset the dimension variables (e.g., latitude, longitude, altitude).

Data size

With griddap data via \texttt{griddap()} you can get a lot of data quickly. Try small searches of a dataset to start to get a sense for the data, then you can increase the amount of data you get. See \texttt{griddap()} for more details.

Caching

\texttt{rerddap} by default caches the requests you make, so that if you happen to make the same request again, the data is restored from the cache, rather than having to go out and retrieve it remotely. For most applications, this is good, as it can speed things up when doing a lot of request in a script, and works because in most cases an ERDDAP request is "idempotent". This means that the the request will always return the same thing no matter what requests came before - it doesn’t depend on state. However this is not true if the script uses either "last" in \texttt{griddap()} or "now" in \texttt{tabledap()} as these will return different values as time elapses and data are added to the datasets. While it is desirable to have ERDDAP purely idempotent, the "last" and "now" constructs are very helpful for people using ERDDAP in dashboards, webpages, regular input to models and the like, and the benefits far outweigh the problems. However, if you are using either "last" or "now" in an \texttt{rerddap} based script, you want to be very careful to clear the \texttt{rerddap} cache, otherwise the request will be viewed as the same, and the data from the last request, rather than the latest data, will be returned.

Scott Chamberlain <myrmecocystus@gmail.com>

\underline{browse} \hspace{1cm} \textit{Browse a dataset webpage.}

Description

Note that it is an error to call this when \texttt{base::interactive()} returns \texttt{FALSE}

Usage

\texttt{browse(x, url = eurl(), ...)}
cache_delete

Delete cached files

**Description**

Delete cached files

**Usage**

```r
cache_delete(x, force = FALSE)
cache_delete_all(force = FALSE)
```
Arguments

x

File names

force

(logical) Should files be force deleted? Default: FALSE

See Also

Other cache: cache_details, cache_list, cache_setup

Examples

## Not run:
# delete files by name in cache
# cache_delete('9911750294a039b8b517c8bf288978ea.csv')
# cache_delete(c('9911750294a039b8b517c8bf288978ea.csv',
#                   'b26825b6737da13d6a52c28c8dfe690f.csv'))

# You can delete from the output of griddap or tabledap fxns
### tabledap
(table_res <- tabledap('erdCinpKfmBT'))
cache_delete(table_res)

### griddap
(out <- info('erdQMekm14day'))
(grid_res <- griddap(out,
                     time = c('2015-12-28','2016-01-01'),
                     latitude = c(24, 23),
                     longitude = c(88, 90))
) cache_delete(grid_res)

## End(Not run)
Details

Can be used to list details for all files, both .nc and .csv types, or details for just individual files of class `tabledap`, `griddap_nc`, and `griddap_csv`.

See Also

Other cache: `cache_delete`, `cache_list`, `cache_setup`

Examples

```r
## Not run:
## List details for all cached files
cache_details()

## End(Not run)
```

```r
cache_list
```

Description

List cached files

Usage

```r
cache_list()
```

See Also

Other cache: `cache_delete`, `cache_details`, `cache_setup`

Examples

```r
## Not run:
## List files in cache
cache_list()

## List info for files
## download some data first
tabledap('erdClnpKfmBT')
griddap('erdVHNchlamday',
    time = c('2015-04-01', '2015-04-10'),
    latitude = c(18, 21),
    longitude = c(-120, -119))

(x <- cache_list())
cache_details(x$nc[1])
cache_details(x$csv[1])
```
### cache_setup

Setup cache path

**Description**

Setup cache path

**Usage**

```r
cache_setup(path_suffix = NULL, temp_dir = FALSE)
```

**Arguments**

- `path_suffix` (character) the path suffix to use for storing cached files, appended to user cache dir.
- `temp_dir` (logical) if TRUE use a randomly assigned tempdir (and `path_suffix` is ignored), if FALSE, you can use `path_suffix`.

**Details**

Looks first if the user has set a cache path suffix in an env var or R option. If not found, proceeds to use a temp directory if not in interactive mode, but if interactive, asks user to setup a default cache location that will work across sessions (but user can say no, in which case a temp directory will be used, and each package start will require cache setup again).

**Value**

the full cache path, a directory (character)

**See Also**

Other cache: `cache_delete`, `cache_details`, `cache_list`
## Not run:

```r
# default path
cache_setup()

# you can define your own path
cache_setup(path = "foobar")

# set a tempdir - better for programming with to avoid prompt
cache_setup(temp_dir = TRUE)

# cache info
cache_info()

## End(Not run)
```

### colors

**cmocean colors** The cmocean color palette by Kristen Thyng as implemented in the R package "oce"

**Description**

`str(colors)` List of 13
- `viridis`
- `cdom`
- `chlorophyll`
- `density`
- `freesurface`
- `oxygen`
- `par`
- `phase`
- `salinity`
- `temperature`
- `turbidity`
- `velocity`
- `vorticity`

**Usage**

```r
colors
```

**Format**

An object of class `list` of length 13.

---

### convert_time

**Convert a UDUNITS compatible time to ISO time**

**Description**

Convert a UDUNITS compatible time to ISO time

**Usage**

```r
convert_time(n = NULL, isoTime = NULL,  
units = "seconds since 1970-01-01T00:00:00Z",  
url = eurl(),  
method = "local", ...)
```
**convert_units**

**Arguments**

- **n** numeric; A unix time number.
- **isoTime** character; A string time representation.
- **units** character; Units to return. Default: "seconds since 1970-01-01T00:00:00Z"
- **url** Base URL of the ERDDAP server. See `eurl()` for more information
- **method** (character) One of local or web. Local simply uses `as.POSIXct()`, while web method uses the ERDDAP time conversion service `/erddap/convert/time.txt`
  
... Curl options passed on to `cru::HttpClient`

**Details**

When `method = "web"` time zone is GMT/UTC

**Examples**

```r
## Not run:
# local conversions
convert_time(n = 473472000)
convert_time(isoTime = "1985-01-02T00:00:00Z")

# using an erddap web service
convert_time(n = 473472000, method = "web")
convert_time(isoTime = "1985-01-02T00:00:00Z", method = "web")
```

## End(Not run)

---

**convert_units** *Convert a CF Standard Name to/from a GCMD Science Keyword*

**Description**

Convert a CF Standard Name to/from a GCMD Science Keyword

**Usage**

```r
convert_units(udunits = NULL, ucum = NULL, url = eurl(), ...)
```

**Arguments**

- **udunits** character; A UDUNITS character string [http://www.unidata.ucar.edu/software/udunits/](http://www.unidata.ucar.edu/software/udunits/)
- **ucum** character; A UCUM character string [http://unitsofmeasure.org/ucum.html](http://unitsofmeasure.org/ucum.html)
- **url** Base URL of the ERDDAP server. See `eurl()` for more information
  
... Curl options passed on to `cru::HttpClient`
Examples

```r
## Not run:
convert_units(udunits = "degree_C meter-1")
convert_units(ucum = "Cel.m-1")
## End(Not run)
```

---

**disk**

*Options for saving ERDDAP datasets.*

---

**Description**

Options for saving ERDDAP datasets.

**Usage**

```r
disk(path = NULL, overwrite = TRUE)
memory()
```

**Arguments**

- **path**: Path to store files in. A directory, not a file. Default: the root cache path, see `cache_setup`
- **overwrite**: (logical) Overwrite an existing file of the same name? Default: TRUE

---

**ed_search**

*Search for ERDDAP tabledep or griddap datasets*

---

**Description**

Search for ERDDAP tabledep or griddap datasets

**Usage**

```r
ed_search(query, page = NULL, page_size = NULL, which = "griddap",
          url = eurl(), ...)
ed_datasets(which = "tabledap", url = eurl())
```
**ed_search_adv**

**ed_search_adv**

**Arguments**

- **query** (character) Search terms
- **page** (integer) Page number
- **page_size** (integer) Results per page
- **which** (character) One of tabledep or griddap.
- **url** A URL for an ERDDAP server. Default: https://upwell.pfeg.noaa.gov/erddap/. See eurl() for more information
- ... Curl options passed on to crul::HttpClient (must be named parameters)

**Author(s)**

Scott Chamberlain myrmecocystus@gmail.com

**References**

https://upwell.pfeg.noaa.gov/erddap/index.html

**Examples**

```r
## Not run:
(out <- ed_search(query='temperature'))
out$alldata[[1]]
(out <- ed_search(query='size'))
out$info

# List datasets
ed_datasets('table')
ed_datasets('grid')

# use a different ERDDAP server
## Marine Institute (Ireland)
ed_search("temperature", url = "http://erddap.marine.ie/erddap/")
```

## End(Not run)
Usage

```r
ed_search_adv(query = NULL, page = 1, page_size = 1000,
protocol = NULL, cdm_data_type = NULL, institution = NULL,
ioos_category = NULL, keywords = NULL, long_name = NULL,
standard_name = NULL, variableName = NULL, maxLat = NULL,
minLon = NULL, maxLon = NULL, minLat = NULL, minTime = NULL,
maxTime = NULL, url = eurl(), ...)
```

Arguments

- **query** (character) Search terms
- **page** (integer) Page number. Default: 1
- **page_size** (integer) Results per page: Default: 1000
- **protocol** (character) One of any (default), tabledep or griddap
- **cdm_data_type** (character) One of grid, other, point, profile, timeseries, timeseriesprofile, trajectory, trajectoryprofile
- **institution** (character) An institution. See the dataset `institutions`
- **ioos_category** (character) An ioos category. See the dataset `ioos_categories`
- **keywords** (character) A keywords. See the dataset `keywords`
- **long_name** (character) A long name. See the dataset `longnames`
- **standard_name** (character) A standard name. See the dataset `standardnames`
- **variableName** (character) A variable name. See the dataset `variablenames`
- **minLon, maxLon** (numeric) Minimum and maximum longitude. Some datasets have longitude values within -180 to 180, others use 0 to 360. If you specify min and max Longitude within -180 to 180 (or 0 to 360), ERDDAP will only find datasets that match the values you specify. Consider doing one search: longitude -180 to 360, or two searches: longitude -180 to 180, and 0 to 360.
- **minLat, maxLat** (numeric) Minimum and maximum latitude, between -90 and 90
- **minTime, maxTime** (numeric/character) Minimum and maximum time. Time string with the format "yyyy-MM-ddTHH:mm:ssZ", (e.g., 2009-01-21T23:00:00Z). If you specify something, you must include at least yyyy-MM-dd; you can omit Z, :ss, :mm, :HH, and T. Always use UTC (GMT/Zulu) time. Or specify the number of seconds since 1970-01-01T00:00:00Z.
- **url** A URL for an ERDDAP server. Default: `https://upwell.pfeg.noaa.gov/erddap/`. See `eurl()` for more information
- **...** Curl options passed on to `crl::HttpClient` (must be named parameters)
eurl

Examples
```r
## Not run:
ed_search_adv(query = 'temperature')
ed_search_adv(query = 'temperature', protocol = "griddap")
ed_search_adv(query = 'temperature', protocol = "tabledap")
ed_search_adv(maxLat = 63, minLon = -107, maxLon = -87, minLat = 50,
protocol = "griddap")
ed_search_adv(maxLat = 63, minLon = -107, maxLon = -87, minLat = 50,
protocol = "tabledap")
ed_search_adv(minTime = "2010-01-01T00:00:00Z",
maxTime="2010-02-01T00:00:00Z")
(out <- ed_search_adv(maxLat = 63, minLon = -107, maxLon = -87, minLat = 50,
minTime = "2010-01-01T00:00:00Z",
maxTime="2010-02-01T00:00:00Z"))
out$alldata[[1]]
ed_search_adv(variableName = 'upwelling')
ed_search_adv(query = 'upwelling', protocol = "tabledap")

# use a different URL
ed_search_adv(query = 'temperature', url = servers()$url[6])

## End(Not run)
```

eurl

Default ERDDAP server URL

Description
Default ERDDAP server URL

Usage
eurl()

2mailto:myrmecocystus@gmail.com
Details

default url is https://upwell.pfeg.noaa.gov/erddap/
You can set a default using an environment variable so you don’t have to pass anything to the URL parameter in your function calls.
In your .Renviron file or similar set a URL for the environment variable RERDDAP_DEFAULT_URL, like RERDDAP_DEFAULT_URL=https://upwell.pfeg.noaa.gov/erddap/
It’s important that you include a trailing slash in your URL

Examples

eurl()
Sys.setenv(RERDDAP_DEFAULT_URL = "https://google.com")
Sys.getenv("RERDDAP_DEFAULT_URL")
eurl()
Sys.unsetenv("RERDDAP_DEFAULT_URL")
eurl()

fipscounty

Convert a FIPS County Code to/from a County Name

Description

Convert a FIPS County Code to/from a County Name

Usage

fipscounty(county = NULL, code = NULL, url = eurl(), ...)

Arguments

 county character; A county name.
 code numeric; A FIPS code.
 url A URL for an ERDDAP server. Default: https://upwell.pfeg.noaa.gov/erddap/. See eurl() for more information
 ... Curl options passed on to crul::HttpClient

Examples

## Not run:
fipscounty(code = "06053")
fipscounty(county = "CA, Monterey")
fipscounty(county = "OR, Multnomah")

## End(Not run)
griddap

Get ERDDAP gridded data

Description

Get ERDDAP gridded data

Usage

griddap(x, ..., fields = "all", stride = 1, fmt = "nc",
url = eurl(), store = disk(), read = TRUE, callopts = list())

Arguments

x

Anything coercable to an object of class info. So the output of a call to info,
or a datasetid, which will internally be passed through info

... Dimension arguments. See examples. Can be any 1 or more of the dimensions
for the particular dataset - and the dimensions vary by dataset. For each dimen-
sion, pass in a vector of length two, with min and max value desired.

fields (character) Fields to return, in a character vector.

stride (integer) How many values to get. 1 = get every value, 2 = get every other value,
etc. Default: 1 (i.e., get every value)

fmt (character) One of csv or nc (for netcdf). Default: nc

gov/erddap/. See eurl() for more information

store One of disk (default) or memory. You can pass options to disk. Beware: if
you choose fmt="nc", we force store=disk() because nc files have to be
written to disk.

read (logical) Read data into memory or not. Does not apply when store parameter
is set to memory (which reads data into memory). For large csv, or especially
netcdf files, you may want to set this to FALSE, which simply returns a summary
of the dataset - and you can read in data piecemeal later. Default: TRUE

callopts Curl options passed on to HttpClient

Details

Details:

If you run into an error like "HTTP Status 500 - There was a (temporary?) problem. Wait a minute,
then try again.". it’s likely they are hitting up against a size limit, and they should reduce the amount
of data they are requesting either via space, time, or variables. Pass in config = verbose() to
the request, and paste the URL into your browser to see if the output is garbled to examine if there’s
a problem with servers or this package
Value

An object of class `griddap_csv` if csv chosen or `griddap_nc` if nc file format chosen.

- `griddap_csv`: a data.frame created from the downloaded csv data
- `griddap_nc`: a list, with slots "summary" and "data". "summary" is the unclassed output from `ncdf4::nc_open`, from which you can do any netcdf operations you like. "data" is a data.frame created from the netcdf data. the data.frame may be empty if there were problems parsing the netcdf data

Both have the attributes: datasetid (the dataset id), path (the path on file for the csv or nc file), url (the url requested to the ERDDAP server)

If `read=FALSE`, the data.frame for `griddap_csv` and the data.frame in the "data" slot is empty for `griddap_nc`

Dimensions and Variables

ERDDAP grid dap data has this concept of dimensions vs. variables. Dimensions are things like time, latitude, longitude, altitude, and depth. Whereas variables are the measured variables, e.g., temperature, salinity, air.

You can’t separately adjust values for dimensions for different variables. So, here’s how it’s gonna work:

Pass in lower and upper limits you want for each dimension as a vector (e.g., `c(1,2)`), or leave to defaults (i.e., don’t pass anything to a dimension). Then pick which variables you want returned via the `fields` parameter. If you don’t pass in options to the `fields` parameter, you get all variables back.

To get the dimensions and variables, along with other metadata for a dataset, run `info`, and each will be shown, with their min and max values, and some other metadata.

Where does the data go?

You can choose where data is stored. Be careful though. You can easily get a single file of hundreds of MB’s (upper limit: 2 GB) in size with a single request. To the `store` parameter, pass `memory` if you want to store the data in memory (saved as a data.frame), or pass `disk` if you want to store on disk in a file. Note that `memory` and `disk` are not character strings, but function calls. `memory` does not accept any inputs, while `disk` does. Possibly will add other options, like “sql” for storing in a SQL database.

Non-lat/lon grid data

Some gridded datasets have latitude/longitude components, but some do not. When nc format gridded datasets have latitude and longitude we "melt" them into a data.frame for easy downstream consumption. When nc format gridded datasets do not have latitude and longitude components, we do not read in the data, throw a warning saying so. You can readin the nc file yourself with the file path. CSV format is not affected by this issue as CSV data is easily turned into a data.frame regardless of whether latitude/longitude data are present.
griddap

References
https://upwell.pfeg.noaa.gov/erddap/rest.html

Examples

```r
## Not run:
# single variable dataset
## You can pass in the output of a call to info
(out <- info('erdVHNchlamday'))
## Or, pass in a dataset id
(res <- griddap('erdVHNchlamday',
    time = c('2015-04-01','2015-04-10'),
    latitude = c(18, 21),
    longitude = c(-120, -119))

# multi-variable dataset
(out <- info('erdQMekm14day'))
(res <- griddap(out,
    time = c('2015-12-28','2016-01-01'),
    latitude = c(24, 23),
    longitude = c(88, 90))
(res <- griddap(out, time = c('2015-12-28','2016-01-01'),
    latitude = c(24, 23), longitude = c(88, 90), fields = 'mod_current'))
(res <- griddap(out, time = c('2015-12-28','2016-01-01'),
    latitude = c(24, 23), longitude = c(88, 90), fields = 'mod_current',
    stride = c(1,2,1,2)))
(res <- griddap(out, time = c('2015-12-28','2016-01-01'),
    latitude = c(24, 23), longitude = c(88, 90),
    fields = c('mod_current','u_current')))  

## Write to memory (within R), or to disk
(out <- info('erdQSwindmday'))
## disk, by default (to prevent bogging down system w/ large datasets)
## you can also pass in path and overwrite options to disk()
(res <- griddap(out,
    time = c('2006-07-11','2006-07-20'),
    longitude = c(166, 170),
    store = disk))

## the 2nd call is much faster as it's mostly just the time of reading in
## the table from disk
system.time( griddap(out,
    time = c('2006-07-11','2006-07-15'),
    store = disk)
```

\(^3\text{mailto:myrmecocystus@gmail.com}\)
```r
longitude = c(10, 15),
store = disk()
)
) )

system.time( griddap(out,
  time = c('2006-07-11','2006-07-15'),
  longitude = c(10, 15),
  store = disk()
) )

## memory - you have to choose fmt="csv" if you use memory
(res <- griddap("erdMBchla1day",
  time = c('2015-01-01','2015-01-03'),
  latitude = c(14, 15),
  longitude = c(125, 126),
  fmt = "csv", store = memory() ) )

## Use ncdf4 package to parse data
info("erdMBchla1day")
(res <- griddap("erdMBchla1day",
  time = c('2015-01-01','2015-01-03'),
  latitude = c(14, 15),
  longitude = c(125, 126)
))

# Get data in csv format
## by default, we get netcdf format data
(res <- griddap('erdMBchla1day',
  time = c('2015-01-01','2015-01-03'),
  latitude = c(14, 15),
  longitude = c(125, 126),
  fmt = "csv"
))

# Use a different ERDDAP server url
## NOAA IOOS PacIOOS
url = "http://oos.soest.hawaii.edu/erddap/
out <- info("NOAA_DHW_5km", url = url)
(res <- griddap(out,

  longitude = c(10, 11)
)

# Using 'last'
## with time
griddap('erdVHNchlamday',

```
Get information on an ERDDAP dataset.

**Description**

Get information on an ERDDAP dataset.

**Usage**

```r
info(datasetid, url = eurl(), ...)

as.info(x, url)
```

**Arguments**

- `datasetid`  
  Dataset id

- `url`  
  A URL for an ERDDAP server. Default: https://upwell.pfeg.noaa.gov/erddap/. See `eurl()` for more information
Further args passed on to crul::HttpClient (must be a named parameter)

A datasetid or the output of info

Value

Prints a summary of the data on return, but you can index to various information.

The data is a list of length two with:

- variables - Data.frame of variables and their types
- alldata - List of data variables and their full attributes

Where alldata element has many data.frame’s, one for each variable, with metadata for that variable. E.g., for griddap dataset noaa_pfeg_696e_ec99_6fa6, alldata has:

- NC_GLOBAL
- time
- latitude
- longitude
- sss

key_words

Description

Convert a CF Standard Name to/from a GCMD Science Keyword

Format

A character vector

Usage

key_words(cf = NULL, gcmd = NULL, url = eurl(), ...)

Arguments

- **cf** character; A CF standard name http://cfconventions.org/Data/cf-standard-names/27/build/cf-standard-name-table.html
- **gcmd** character; A GCMD science keyword http://gcmd.gsfc.nasa.gov/learn/keyword_list.html
- **url** A URL for an ERDDAP server. Default: https://upwell.pfeg.noaa.gov/erddap/. See `eurl()` for more information
- ... Curl options passed on to `crl::HttpClient`

Examples

```r
# Not run:
key_words(cf = "air_pressure")
cat(key_words(cf = "air_pressure"))

# a different ERDDAP server
# key_words(cf = "air_pressure", url = servers()$url[6])

Description
standardnames

Format
A character vector
tabledap

Get ERDDAP tabledap data.

Description

Get ERDDAP tabledap data.

Usage

```r
tabledap(x, ..., fields = NULL, distinct = FALSE, orderby = NULL,
          orderbymax = NULL, orderbymin = NULL, orderbyminmax = NULL,
          units = NULL, url = eurl(), store = disk(), callopts = list())
```

Arguments

- **x**
  Anything coercable to an object of class `info`. So the output of a call to `info()`, or a datasetid, which will internally be passed through `info()`
- **...**
  Any number of key-value pairs in quotes as query constraints. See Details & examples
- **fields**
  Columns to return, as a character vector
- **distinct**
  If TRUE ERDDAP will sort all of the rows in the results table (starting with the first requested variable, then using the second requested variable if the first variable has a tie, ...), then remove all non-unique rows of data. In many situations, ERDDAP can return distinct values quickly and efficiently. But in some cases, ERDDAP must look through all rows of the source dataset.
- **orderby**
  If used, ERDDAP will sort all of the rows in the results table (starting with the first variable, then using the second variable if the first variable has a tie, ...). Normally, the rows of data in the response table are in the order they arrived from the data source. orderBy allows you to request that the results table be sorted in a specific way. For example, use `orderby=c("stationID", "time")` to get the results sorted by stationID, then time. The orderby variables MUST be included in the list of requested variables in the fields parameter.
- **orderbymax**
  Give a vector of one or more fields, that must be included in the fields parameter as well. Gives back data given constraints. ERDDAP will sort all of the rows in the results table (starting with the first variable, then using the second variable if the first variable has a tie, ...) and then just keeps the rows where the value of the last sort variable is highest (for each combination of other values).
- **orderbymin**
  Same as `orderbymax` parameter, except returns minimum value.
- **orderbyminmax**
  Same as `orderbymax` parameter, except returns two rows for every combination of the n-1 variables: one row with the minimum value, and one row with the maximum value.
- **units**
  One of `udunits` (units will be described via the UDUNITS standard (e.g., degrees_C)) or `ucum` (units will be described via the UCUM standard (e.g., Cel)).
A URL for an ERDDAP server. Default: https://upwell.pfeg.noaa.gov/erddap/ See eurl() for more information

One of disk (default) or memory. You can pass options to disk

Curl options passed on to crul::HttpClient (must be named parameters)

For key-value pair query constraints, the valid operators are =, != (not equals), =~ (a regular expression test), <, <=, >, and >=. For regular expressions you need to add a regular expression.
For others, nothing more is needed. Construct the entry like 'time>=2001-07-07' with the parameter on the left, value on the right, and the operator in the middle, all within a set of quotes.
Since ERDDAP accepts values other than =, we can’t simply do time = '2001-07-07' as we normally would.

Server-side functionality: Some tasks are done server side. You don’t have to worry about what that means. They are provided via parameters in this function. See distinct, orderby, orderbymin, orderbyminmax, and units.

Data is cached based on all parameters you use to get a dataset, including base url, query parameters. If you make the same exact call in the same or a different R session, as long you don’t clear the cache, the function only reads data from disk, and does not have to request the data from the web again.

If you run into an error like "HTTP Status 500 - There was a (temporary?) problem. Wait a minute, then try again.". it’s likely they are hitting up against a size limit, and they should reduce the amount of data they are requesting either via space, time, or variables. Pass in config = verbose() to the request, and paste the URL into your browser to see if the output is garbled to examine if there’s a problem with servers or this package

An object of class tabledap. This class is a thin wrapper around a data.frame, so the data you get back is a data.frame with metadata attached as attributes (datasetid, path (path where the csv is stored on your machine), url (url for the request))
