

# Package ‘TidyDensity’

October 30, 2023

**Title** Functions for Tidy Analysis and Generation of Random Data

**Version** 1.2.6

**Description** To make it easy to generate random numbers based upon the underlying stats distribution functions. All data is returned in a tidy and structured format making working with the data simple and straight forward. Given that the data is returned in a tidy 'tibble' it lends itself to working with the rest of the 'tidyverse'.

**License** MIT + file LICENSE

**Encoding** UTF-8

**RoxygenNote** 7.2.3

**URL** <https://github.com/spsanderson/TidyDensity>

**BugReports** <https://github.com/spsanderson/TidyDensity/issues>

**Imports** magrittr, rlang ( $\geq 0.4.11$ ), dplyr, ggplot2, plotly, tidyr, purrr, actuar, methods, stats, patchwork, survival, nloptr, broom, tidyselect, data.table

**Suggests** rmarkdown, knitr, roxygen2, EnvStats

**VignetteBuilder** knitr

**NeedsCompilation** no

**Author** Steven Sanderson [aut, cre, cph]

bootstrap\_density\_augment  
*Bootstrap Density Tibble*

---

## Description

Add density information to the output of `tidy_bootstrap()`, and `bootstrap_unnest_tbl()`.

## Usage

```
bootstrap_density_augment(.data)
```

## Arguments

|                    |  |
|--------------------|--|
| <code>.data</code> | The data that is passed from the <code>tidy_bootstrap()</code> or <code>bootstrap_unnest_tbl()</code> functions. |
|--------------------|--|

## Details

This function takes as input the output of the `tidy_bootstrap()` or `bootstrap_unnest_tbl()` and returns an augmented tibble that has the following columns added to it: `x`, `y`, `dx`, and `dy`.

It looks for an attribute that comes from using `tidy_bootstrap()` or `bootstrap_unnest_tbl()` so it will not work unless the data comes from one of those functions.

## Value

A tibble

## Author(s)

Steven P. Sanderson II, MPH

Other Augment Function: [bootstrap\\_p\\_augment\(\)](#), [bootstrap\\_q\\_augment\(\)](#)

**Examples**

```
x <- mtcars$mpg

tidy_bootstrap(x) %>%
  bootstrap_density_augment()

tidy_bootstrap(x) %>%
  bootstrap_unnest_tbl() %>%
  bootstrap_density_augment()
```

---

bootstrap\_p\_augment    *Augment Bootstrap P*

---

**Description**

Takes a numeric vector and will return the ecdf probability.

**Usage**

```
bootstrap_p_augment(.data, .value, .names = "auto")
```

**Arguments**

|                     |   |
|---------------------|---|
| <code>.data</code>  | The data being passed that will be augmented by the function.                             |
| <code>.value</code> | This is passed <a href="#">rlang::enquo()</a> to capture the vectors you want to augment. |
| <code>.names</code> | The default is "auto"   |

**Details**

Takes a numeric vector and will return the ecdf probability of that vector. This function is intended to be used on its own in order to add columns to a tibble.

**Value**

A augmented tibble

**Author(s)**

Steven P. Sanderson II, MPH

| bootstrap_p_vec | <i>Compute Bootstrap P of a Vector</i> |
|-----------------|--|

---

**Description**

This function takes in a vector as it's input and will return the ecdf probability of a vector.

**Usage**

```
bootstrap_p_vec(.x)
```

**Arguments**

`.x` A numeric

**Details**

A function to return the ecdf probability of a vector.

**Value**

A vector

**Author(s)**

Steven P. Sanderson II, MPH

## Examples

```
x <- mtcars$mpg
bootstrap_p_vec(x)
```

---

bootstrap\_q\_augment     *Augment Bootstrap Q*

---

## Description

Takes a numeric vector and will return the quantile.

## Usage

```
bootstrap_q_augment(.data, .value, .names = "auto")
```

## Arguments

|                     |  |
|---------------------|--|
| <code>.data</code>  | The data being passed that will be augmented by the function.                          |
| <code>.value</code> | This is passed <code>rlang::enquo()</code> to capture the vectors you want to augment. |
| <code>.names</code> | The default is "auto"  |

## Details

Takes a numeric vector and will return the quantile of that vector. This function is intended to be used on its own in order to add columns to a tibble.

## Value

A augmented tibble

### Description

This function takes in a vector as it's input and will return the quantile of a vector.

### Usage

```
bootstrap_q_vec(.x)
```

### Arguments

`.x` A numeric

### Details

A function to return the quantile of a vector.

### Value

A vector

### Author(s)

Steven P. Sanderson II, MPH

### See Also

Other Bootstrap: [bootstrap\\_density\\_augment\(\)](#), [bootstrap\\_p\\_augment\(\)](#), [bootstrap\\_p\\_vec\(\)](#), [bootstrap\\_q\\_augment\(\)](#), [bootstrap\\_stat\\_plot\(\)](#), [bootstrap\\_unnest\\_tbl\(\)](#), [tidy\\_bootstrap\(\)](#)

Other Vector Function: [bootstrap\\_p\\_vec\(\)](#), [cgmean\(\)](#), [chmean\(\)](#), [ckurtosis\(\)](#), [cmean\(\)](#), [cmedian\(\)](#), [csd\(\)](#), [cskewness\(\)](#), [cvar\(\)](#), [tidy\\_kurtosis\\_vec\(\)](#), [tidy\\_scale\\_zero\\_one\\_vec\(\)](#), [tidy\\_skewness\\_vec\(\)](#)

### Examples

```
x <- mtcars$mpg  
  
bootstrap_q_vec(x)
```

---

bootstrap\_stat\_plot *Bootstrap Stat Plot*

---

## Description

This function produces a plot of a cumulative statistic function applied to the bootstrap variable from `tidy_bootstrap()` or after `bootstrap_unnest_tbl()` has been applied to it.

## Usage

```
bootstrap_stat_plot(  
  .data,  
  .value,  
  .stat = "cmean",  
  .show_groups = FALSE,  
  .show_ci_labels = TRUE,  
  .interactive = FALSE  
)
```

## Arguments

|                              |   |
|------------------------------|---|
| <code>.data</code>           | The data that comes from either <code>tidy_bootstrap()</code> or after <code>bootstrap_unnest_tbl()</code> is applied to it.  |
| <code>.value</code>          | The value column that the calculations are being applied to.  |
| <code>.stat</code>           | The cumulative statistic function being applied to the <code>.value</code> column. It must be quoted. The default is "cmean". |
| <code>.show_groups</code>    | The default is FALSE, set to TRUE to get output of all simulations of the bootstrap data.                                     |
| <code>.show_ci_labels</code> | The default is TRUE, this will show the last value of the upper and lower quantile.   |
| <code>.interactive</code>    | The default is FALSE, set to TRUE to get a plotly plot object back.   |

## Details

This function will take in data from either `tidy_bootstrap()` directly or after apply `bootstrap_unnest_tbl()` to its output. There are several different cumulative functions that can be applied to the data. The accepted values are:

- "cmean" - Cumulative Mean
- "chmean" - Cumulative Harmonic Mean
- "cgmean" - Cumulative Geometric Mean
- "csum" = Cumulative Sum
- "cmedian" = Cumulative Median

- "cmax" = Cumulative Max
- "cmin" = Cumulative Min
- "cprod" = Cumulative Product
- "csd" = Cumulative Standard Deviation
- "cvar" = Cumulative Variance
- "c skewness" = Cumulative Skewness
- "ckurtosis" = Cumulative Kurtosis

**Value**

A plot either ggplot2 or plotly.

**Author(s)**

Steven P. Sanderson II, MPH

**See Also**

Other Bootstrap: [bootstrap\\_density\\_augment\(\)](#), [bootstrap\\_p\\_augment\(\)](#), [bootstrap\\_p\\_vec\(\)](#), [bootstrap\\_q\\_augment\(\)](#), [bootstrap\\_q\\_vec\(\)](#), [bootstrap\\_unnest\\_tbl\(\)](#), [tidy\\_bootstrap\(\)](#)

Other Autoplot: [tidyautoplot\(\)](#), [tidy\\_combinedautoplot\(\)](#), [tidy\\_fourautoplot\(\)](#), [tidy\\_multi\\_distautoplot\(\)](#), [tidy\\_random\\_walkautoplot\(\)](#)

**Examples**

```
x <- mtcars$mpg

tidy_bootstrap(x) %>%
  bootstrap_stat_plot(y, "cmean")

tidy_bootstrap(x, .num_sims = 10) %>%
  bootstrap_stat_plot(y,
    .stat = "chmean", .show_groups = TRUE,
    .show_ci_label = FALSE
  )
```

---

bootstrap\_unnest\_tbl *Unnest Tidy Bootstrap Tibble*

---

**Description**

Unnest the data output from `tidy_bootstrap()`.

**Usage**

```
bootstrap_unnest_tbl(.data)
```

**Arguments**

`.data` The data that is passed from the `tidy_bootstrap()` function.

**Details**

This function takes as input the output of the `tidy_bootstrap()` function and returns a two column tibble. The columns are `sim_number` and `y`

It looks for an attribute that comes from using `tidy_bootstrap()` so it will not work unless the data comes from that function.

**Value**

A tibble

**Author(s)**

Steven P. Sanderson II, MPH

**See Also**

Other Bootstrap: [bootstrap\\_density\\_augment\(\)](#), [bootstrap\\_p\\_augment\(\)](#), [bootstrap\\_p\\_vec\(\)](#), [bootstrap\\_q\\_augment\(\)](#), [bootstrap\\_q\\_vec\(\)](#), [bootstrap\\_stat\\_plot\(\)](#), [tidy\\_bootstrap\(\)](#)

**Examples**

```
tb <- tidy_bootstrap(.x = mtcars$mpg)
bootstrap_unnest_tbl(tb)

bootstrap_unnest_tbl(tb) %>%
  tidy_distribution_summary_tbl(sim_number)
```

---

cgmean

*Cumulative Geometric Mean*

---

**Description**

A function to return the cumulative geometric mean of a vector.

**Usage**

```
cgmean(.x)
```

**Arguments**

`.x` A numeric vector

**Details**

A function to return the cumulative geometric mean of a vector. `exp(cummean(log(.x)))`

**Value**

A numeric vector

**Author(s)**

Steven P. Sanderson II, MPH

**See Also**

Other Vector Function: [bootstrap\\_p\\_vec\(\)](#), [bootstrap\\_q\\_vec\(\)](#), [chmean\(\)](#), [ckurtosis\(\)](#), [cmean\(\)](#), [cmedian\(\)](#), [csd\(\)](#), [cskewness\(\)](#), [cvar\(\)](#), [tidy\\_kurtosis\\_vec\(\)](#), [tidy\\_scale\\_zero\\_one\\_vec\(\)](#), [tidy\\_skewness\\_vec\(\)](#)

**Examples**

```
x <- mtcars$mpg
cgmean(x)
```

---

chmean

*Cumulative Harmonic Mean*

---

**Description**

A function to return the cumulative harmonic mean of a vector.

**Usage**

```
chmean(.x)
```

**Arguments**

`.x` A numeric vector

**Details**

A function to return the cumulative harmonic mean of a vector. `1 / (cumsum(1 / .x))`

**Value**

A numeric vector

**Author(s)**

ci\_hi

*Confidence Interval Generic*

---

**Description**

Gets the upper 97.5% quantile of a numeric vector.

**Usage**

```
ci_hi(.x, .na_rm = FALSE)
```

**Arguments**

`.x` A vector of numeric values  
`.na_rm` A Boolean, defaults to FALSE. Passed to the quantile function.

**Details**

Gets the upper 97.5% quantile of a numeric vector.

**Value**

A numeric value.

`ci_lo`*Confidence Interval Generic*

---

**Description**

Gets the lower 2.5% quantile of a numeric vector.

**Usage**

```
ci_lo(.x, .na_rm = FALSE)
```

**Arguments**

`.x` A vector of numeric values  
`.na_rm` A Boolean, defaults to FALSE. Passed to the quantile function.

**Details**

Gets the lower 2.5% quantile of a numeric vector.

**Value**

A numeric value.

```

---

|             |  |
|-------------|--|
| color_blind | <i>Provide Colorblind Compliant Colors</i> |
|-------------|--|

---

**Description**

8 Hex RGB color definitions suitable for charts for colorblind people.

**Usage**

```
color_blind()
```

---

|               |   |
|---------------|---|
| convert_to_ts | <i>Convert Data to Time Series Format</i> |
|---------------|---|

---

**Description**

This function converts data in a data frame or tibble into a time series format. It is designed to work with data generated from `tidy_` distribution functions. The function can return time series data, pivot it into long format, or both.

**Usage**

```
convert_to_ts(.data, .return_ts = TRUE, .pivot_longer = FALSE)
```

**Arguments**

|                            |  |
|----------------------------|--|
| <code>.data</code>         | A data frame or tibble to be converted into a time series format.                        |
| <code>.return_ts</code>    | A logical value indicating whether to return the time series data. Default is TRUE.      |
| <code>.pivot_longer</code> | A logical value indicating whether to pivot the data into long format. Default is FALSE. |

**Details**

The function takes a data frame or tibble as input and processes it based on the specified options. It performs the following actions:

1. Checks if the input is a data frame or tibble; otherwise, it raises an error.
2. Checks if the data comes from a `tidy_` distribution function; otherwise, it raises an error.
3. Converts the data into a time series format, grouping it by "sim\_number" and transforming the "y" column into a time series.
4. Returns the result based on the chosen options:
  - If `ret_ts` is set to TRUE, it returns the time series data.
  - If `pivot_longer` is set to TRUE, it pivots the data into long format.
  - If both options are set to FALSE, it returns the data as a tibble.

**Value**

The function returns the processed data based on the chosen options:

- If `ret_ts` is set to `TRUE`, it returns time series data.
- If `pivot_longer` is set to `TRUE`, it returns the data in long format.
- If both options are set to `FALSE`, it returns the data as a tibble.

**Author(s)**

Steven P. Sanderson II, MPH

**Examples**

```
# Example 1: Convert data to time series format without returning time series data
x <- tidy_normal()
result <- convert_to_ts(x, FALSE)
head(result)

# Example 2: Convert data to time series format and pivot it into long format
x <- tidy_normal()
result <- convert_to_ts(x, FALSE, TRUE)
head(result)

# Example 3: Convert data to time series format and return the time series data
x <- tidy_normal()
result <- convert_to_ts(x)
head(result)
```

---

csd

*Cumulative Standard Deviation*

---

**Description**

A function to return the cumulative standard deviation of a vector.

**Usage**

```
csd(.x)
```

**Arguments**

`.x` A numeric vector

**Details**

A function to return the cumulative standard deviation of a vector.

**Value**

A numeric vector

**Author(s)**

Steven P. Sanderson II, MPH

**Examples**

```
x <- mtcars$mpg
cvar(x)
```

---

dist\_type\_extractor     *Extract Distribution Type from Tidy Distribution Object*

---

### Description

Get the distribution name in title case from the tidy\_ distribution function.

### Usage

```
dist_type_extractor(.x)
```

### Arguments

.x                    The attribute list passed from a tidy\_ distribution function.

### Details

This will extract the distribution type from a tidy\_ distribution function output using the attributes of that object. You must pass the attribute directly to the function. It is meant really to be used internally.

You should be passing if using manually the \$tibble\_type attribute.

### Value

A character string

### Author(s)

Steven P. Sanderson II,

### Examples

```
tn <- tidy_normal()
atb <- attributes(tn)
dist_type_extractor(atb$tibble_type)
```

---

`td_scale_color_colorblind`*Provide Colorblind Compliant Colors*

---

**Description**

Provide Colorblind Compliant Colors

**Usage**

```
td_scale_color_colorblind(..., theme = "td")
```

**Arguments**

|                    |   |
|--------------------|---|
| <code>...</code>   | Data passed to the function   |
| <code>theme</code> | This defaults to <code>td</code> and that is the only allowed value |

---

`td_scale_fill_colorblind`*Provide Colorblind Compliant Colors*

---

**Description**

Provide Colorblind Compliant Colors

**Usage**

```
td_scale_fill_colorblind(..., theme = "td")
```

**Arguments**

|                    |   |
|--------------------|---|
| <code>...</code>   | Data passed to the function   |
| <code>theme</code> | This defaults to <code>td</code> and that is the only allowed value |

tidy\_autoplot

*Automatic Plot of Density Data***Description**

This is an auto plotting function that will take in a tidy\_ distribution function and a few arguments, one being the plot type, which is a quoted string of one of the following:

- density
- quantile
- probablity
- qq
- mcmc

If the number of simulations exceeds 9 then the legend will not print. The plot subtitle is put together by the attributes of the table passed to the function.

**Usage**

```
tidy_autoplot(
  .data,
  .plot_type = "density",
  .line_size = 0.5,
  .geom_point = FALSE,
  .point_size = 1,
  .geom_rug = FALSE,
  .geom_smooth = FALSE,
  .geom_jitter = FALSE,
  .interactive = FALSE
)
```

**Arguments**

|              |  |
|--------------|--|
| .data        | The data passed in from a tidy_distribution function like tidy_normal()  |
| .plot_type   | This is a quoted string like 'density'   |
| .line_size   | The size param ggplot  |
| .geom_point  | A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return a plot with ggplot2::geom_point()  |
| .point_size  | The point size param for ggplot  |
| .geom_rug    | A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return the use of ggplot2::geom_rug()   |
| .geom_smooth | A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return the use of ggplot2::geom_smooth() The aes parameter of group is set to FALSE. This ensures a single smoothing band returned with SE also set to FALSE. Color is set to 'black' and linetype is 'dashed'. |

- `.geom_jitter` A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return the use of `ggplot2::geom_jitter()`
- `.interactive` A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return an interactive plotly plot.

### Details

This function will spit out one of the following plots:

- density
- quantile
- probability
- qq
- mcmc

### Value

A ggplot or a plotly plot.

### Author(s)

Steven P. Sanderson II, MPH

### See Also

|                             |  |
|-----------------------------|--|
| <code>tidy_bernoulli</code> | <i>Tidy Randomly Generated Bernoulli Distribution Tibble</i> |
|-----------------------------|--|

---

### Description

This function will generate `n` random points from a Bernoulli distribution with a user provided, `.prob`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of `n` for the current simulation.
- `y` The randomly generated data point.
- `dx` The `x` value from the `stats::density()` function.
- `dy` The `y` value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

### Usage

```
tidy_bernoulli(.n = 50, .prob = 0.1, .num_sims = 1)
```

### Arguments

|                        |  |
|------------------------|--|
| <code>.n</code>        | The number of randomly generated points you want.      |
| <code>.prob</code>     | The probability of success/failure.                    |
| <code>.num_sims</code> | The number of randomly generated simulations you want. |

### Details

This function uses the `rbinom()`, and its underlying `p`, `d`, and `q` functions. The *Bernoulli* distribution is a special case of the *Binomial* distribution with `size = 1` hence this is why the `binom` functions are used and set to `size = 1`.

### Value

A tibble of randomly generated data.

### Author(s)

Steven P. Sanderson II, MPH

`tidy_beta`*Tidy Randomly Generated Beta Distribution Tibble*

---

## Description

This function will generate `n` random points from a beta distribution with a user provided, `.shape1`, `.shape2`, `.ncp` or non-centrality parameter, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of `n` for the current simulation.
- `y` The randomly generated data point.
- `dx` The `x` value from the `stats::density()` function.
- `dy` The `y` value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

## Usage

```
tidy_beta(.n = 50, .shape1 = 1, .shape2 = 1, .ncp = 0, .num_sims = 1)
```

## Arguments

|                        |  |
|------------------------|--|
| <code>.n</code>        | The number of randomly generated points you want.      |
| <code>.shape1</code>   | A non-negative parameter of the Beta distribution.     |
| <code>.shape2</code>   | A non-negative parameter of the Beta distribution.     |
| <code>.ncp</code>      | The non-centrality parameter of the Beta distribution. |
| <code>.num_sims</code> | The number of randomly generated simulations you want. |

## Details

This function uses the underlying `stats::rbeta()`, and its underlying `p`, `d`, and `q` functions. For more information please see [stats::rbeta\(\)](#)

## Value

A tibble of randomly generated data.

**Description**

This function will generate `n` random points from a binomial distribution with a user provided, `.size`, `.prob`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of `n` for the current simulation.
- `y` The randomly generated data point.
- `dx` The `x` value from the `stats::density()` function.
- `dy` The `y` value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_binomial(.n = 50, .size = 0, .prob = 1, .num_sims = 1)
```

**Arguments**

|                        |  |
|------------------------|--|
| <code>.n</code>        | The number of randomly generated points you want.      |
| <code>.size</code>     | Number of trials, zero or more.                        |
| <code>.prob</code>     | Probability of success on each trial.                  |
| <code>.num_sims</code> | The number of randomly generated simulations you want. |

**Details**

This function uses the underlying `stats::rbinom()`, and its underlying `p`, `d`, and `q` functions. For more information please see `stats::rbinom()`

**Value**

A tibble of randomly generated data.

tidy_binomial()
```

---

tidy\_bootstrap

*Bootstrap Empirical Data*

---

**Description**

Takes an input vector of numeric data and produces a bootstrapped nested tibble by simulation number.

**Usage**

```
tidy_bootstrap(  
  .x,  
  .num_sims = 2000,  
  .proportion = 0.8,  
  .distribution_type = "continuous"  
)
```

**Arguments**

|                                 |   |
|---------------------------------|---|
| <code>.x</code>                 | The vector of data being passed to the function. Must be a numeric vector.  |
| <code>.num_sims</code>          | The default is 2000, can be set to anything desired. A warning will pass to the console if the value is less than 2000. |
| <code>.proportion</code>        | How much of the original data do you want to pass through to the sampling function. The default is 0.80 (80%)           |
| <code>.distribution_type</code> | This can either be 'continuous' or 'discrete'   |

**Details**

This function will take in a numeric input vector and produce a tibble of bootstrapped values in a list. The table that is output will have two columns: `sim_number` and `bootstrap_samples`

The `sim_number` corresponds to how many times you want the data to be resampled, and the `bootstrap_samples` column contains a list of the bootstrapped resampled data.

**Value**

A nested tibble

tidy\_burr

*Tidy Randomly Generated Burr Distribution Tibble*

---

**Description**

This function will generate `n` random points from a Burr distribution with a user provided, `.shape1`, `.shape2`, `.scale`, `.rate`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of `n` for the current simulation.
- `y` The randomly generated data point.
- `dx` The `x` value from the `stats::density()` function.
- `dy` The `y` value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

### Usage

```
tidy_burr(  
  .n = 50,  
  .shape1 = 1,  
  .shape2 = 1,  
  .rate = 1,  
  .scale = 1/.rate,  
  .num_sims = 1  
)
```

### Arguments

|                        |   |
|------------------------|---|
| <code>.n</code>        | The number of randomly generated points you want.       |
| <code>.shape1</code>   | Must be strictly positive.                              |
| <code>.shape2</code>   | Must be strictly positive.                              |
| <code>.rate</code>     | An alternative way to specify the <code>.scale</code> . |
| <code>.scale</code>    | Must be strictly positive.                              |
| <code>.num_sims</code> | The number of randomly generated simulations you want.  |

### Details

This function uses the underlying `actuar::rburr()`, and its underlying `p`, `d`, and `q` functions. For more information please see [actuar::rburr\(\)](#)

### Value

A tibble of randomly generated data.

### Author(s)

```

```
Tidy Randomly Generated Cauchy Distribution Tibble
```

---

**Description**

This function will generate `n` random points from a cauchy distribution with a user provided, `.location`, `.scale`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of `n` for the current simulation.
- `y` The randomly generated data point.
- `dx` The `x` value from the `stats::density()` function.
- `dy` The `y` value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_cauchy(.n = 50, .location = 0, .scale = 1, .num_sims = 1)
```

**Arguments**

|                        |  |
|------------------------|--|
| <code>.n</code>        | The number of randomly generated points you want.        |
| <code>.location</code> | The location parameter.                                  |
| <code>.scale</code>    | The scale parameter, must be greater than or equal to 0. |
| <code>.num_sims</code> | The number of randomly generated simulations you want.   |

**Details**

This function uses the underlying `stats::rcauchy()`, and its underlying `p`, `d`, and `q` functions. For more information please see [stats::rcauchy\(\)](#)

**Value**

A tibble of randomly generated data.

|----------------|--|
| tidy_chisquare | <i>Tidy Randomly Generated Chisquare (Non-Central) Distribution Tibble</i> |
|----------------|--|

---

**Description**

This function will generate `n` random points from a chisquare distribution with a user provided, `.df`, `.ncp`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of `n` for the current simulation.
- `y` The randomly generated data point.
- `dx` The `x` value from the [stats::density\(\)](#) function.
- `dy` The `y` value from the [stats::density\(\)](#) function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_chisquare(.n = 50, .df = 1, .ncp = 1, .num_sims = 1)
```

**Arguments**

|                        |  |
|------------------------|--|
| <code>.n</code>        | The number of randomly generated points you want.        |
| <code>.df</code>       | Degrees of freedom (non-negative but can be non-integer) |
| <code>.ncp</code>      | Non-centrality parameter, must be non-negative.          |
| <code>.num_sims</code> | The number of randomly generated simulations you want.   |

**Details**

This function uses the underlying `stats::rchisq()`, and its underlying p, d, and q functions. For more information please see [stats::rchisq\(\)](#)

tidy\_combinedautoplot

*Automatic Plot of Combined Multi Dist Data*

---

## Description

This is an auto plotting function that will take in a tidy\_ distribution function and a few arguments, one being the plot type, which is a quoted string of one of the following:

- density
- quantile
- probability
- qq

If the number of simulations exceeds 9 then the legend will not print. The plot subtitle is put together by the attributes of the table passed to the function.

## Usage

```
tidy_combinedautoplot(
  .data,
  .plot_type = "density",
  .line_size = 0.5,
  .geom_point = FALSE,
  .point_size = 1,
  .geom_rug = FALSE,
  .geom_smooth = FALSE,
  .geom_jitter = FALSE,
  .interactive = FALSE
)
```

## Arguments

|              |  |
|--------------|--|
| .data        | The data passed in from a the function tidy_multi_dist()   |
| .plot_type   | This is a quoted string like 'density'   |
| .line_size   | The size param ggplot  |
| .geom_point  | A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return a plot with ggplot2::geom_point()  |
| .point_size  | The point size param for ggplot  |
| .geom_rug    | A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return the use of ggplot2::geom_rug()   |
| .geom_smooth | A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return the use of ggplot2::geom_smooth() The aes parameter of group is set to FALSE. This ensures a single smoothing band returned with SE also set to FALSE. Color is set to 'black' and linetype is 'dashed'. |

|                           |  |
|---------------------------|--|
| <code>.geom_jitter</code> | A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return the use of <code>ggplot2::geom_jitter()</code> |
| <code>.interactive</code> | A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return an interactive plotly plot.                    |

### Details

This function will spit out one of the following plots:

- density
- quantile
- probability
- qq

### Value

A ggplot or a plotly plot.

---

`tidy_combine_distributions`*Combine Multiple Tidy Distributions of Different Types*

---

**Description**

This allows a user to specify any n number of tidy\_ distributions that can be combined into a single tibble. This is the preferred method for combining multiple distributions of different types, for example a Gaussian distribution and a Beta distribution.

This generates a single tibble with an added column of dist\_type that will give the distribution family name and its associated parameters.

**Usage**

```
tidy_combine_distributions(...)
```

**Arguments**

...                   The ... is where you can place your different distributions

**Details**

Allows a user to generate a tibble of different tidy\_ distributions

**Value**

A tibble

**Author(s)**

Steven P. Sanderson II, MPH

**See Also**

Other Multiple Distribution: [tidy\\_multi\\_single\\_dist\(\)](#)

**Examples**

```
tn <- tidy_normal()
tb <- tidy_beta()
tc <- tidy_cauchy()

tidy_combine_distributions(tn, tb, tc)

## OR

tidy_combine_distributions(
```

```
tidy_normal(),
tidy_beta(),
tidy_cauchy(),
tidy_logistic()
)
```

---

tidy\_distribution\_comparison

*Compare Empirical Data to Distributions*

---

### Description

Compare some empirical data set against different distributions to help find the distribution that could be the best fit.

### Usage

```
tidy_distribution_comparison(
  .x,
  .distribution_type = "continuous",
  .round_to_place = 3
)
```

### Arguments

|                                 |  |
|---------------------------------|--|
| <code>.x</code>                 | The data set being passed to the function  |
| <code>.distribution_type</code> | What kind of data is it, can be one of continuous or discrete  |
| <code>.round_to_place</code>    | How many decimal places should the parameter estimates be rounded off to for distribution construction. The default is 3 |

### Details

The purpose of this function is to take some data set provided and to try to find a distribution that may fit the best. A parameter of `.distribution_type` must be set to either continuous or discrete in order for this the function to try the appropriate types of distributions.

The following distributions are used:

Continuous:

- tidy\_beta
- tidy\_cauchy
- tidy\_exponential
- tidy\_gamma
- tidy\_logistic

- tidy\_lognormal
- tidy\_normal
- tidy\_pareto
- tidy\_uniform
- tidy\_weibull

Discrete:

- tidy\_binomial
- tidy\_geometric
- tidy\_hypergeometric
- tidy\_poisson

The function itself returns a list output of tibbles. Here are the tibbles that are returned:

- comparison\_tbl
- deviance\_tbl
- total\_deviance\_tbl
- aic\_tbl
- kolmogorov\_smirnov\_tbl
- multi\_metric\_tbl

The `comparison_tbl` is a long tibble that lists the values of the density function against the given data.

The `deviance_tbl` and the `total_deviance_tbl` just give the simple difference from the actual density to the estimated density for the given estimated distribution.

The `aic_tbl` will provide the AIC for a `lm` model of the estimated density against the empirical density.

The `kolmogorov_smirnov_tbl` for now provides a `two.sided` estimate of the `ks.test` of the estimated density against the empirical.

The `multi_metric_tbl` will summarise all of these metrics into a single tibble.

## Value

An invisible list object. A tibble is printed.

## Author(s)

Steven P. Sanderson II, MPH

## Examples

```
xc <- mtcars$mpg
output_c <- tidy_distribution_comparison(xc, "continuous")

xd <- trunc(xc)
output_d <- tidy_distribution_comparison(xd, "discrete")

output_c
```

---

tidy\_distribution\_summary\_tbl

*Tidy Distribution Summary Statistics Tibble*

---

## Description

This function returns a summary statistics tibble. It will use the y column from the tidy\_ distribution function.

## Usage

```
tidy_distribution_summary_tbl(.data, ...)
```

## Arguments

.data            The data that is going to be passed from a a tidy\_ distribution function.  
...             This is the grouping variable that gets passed to `dplyr::group_by()` and `dplyr::select()`.

## Details

This function takes in a tidy\_ distribution table and will return a tibble of the following information:

- sim\_number
- mean\_val
- median\_val
- std\_val
- min\_val
- max\_val
- skewness
- kurtosis
- range
- iqr
- variance
- ci\_hi
- ci\_lo

The kurtosis and skewness come from the package `healthyR.ai`

**Value**

A summary stats tibble

**Author(s)**

Steven P. Sanderson II, MPH

**Examples**

```
library(dplyr)

tn <- tidy_normal(.num_sims = 5)
tb <- tidy_beta(.num_sims = 5)

tidy_distribution_summary_tbl(tn)
tidy_distribution_summary_tbl(tn, sim_number)

data_tbl <- tidy_combine_distributions(tn, tb)

tidy_distribution_summary_tbl(data_tbl)
tidy_distribution_summary_tbl(data_tbl, dist_type)
```

---

|                |                       |
|----------------|-----------------------|
| tidy_empirical | <i>Tidy Empirical</i> |
|----------------|-----------------------|

---

**Description**

This function takes in a single argument of `.x` a vector and will return a tibble of information similar to the `tidy_distribution` functions. The `y` column is set equal to `dy` from the density function.

**Usage**

```
tidy_empirical(.x, .num_sims = 1, .distribution_type = "continuous")
```

**Arguments**

|                                 |  |
|---------------------------------|--|
| <code>.x</code>                 | A vector of numbers  |
| <code>.num_sims</code>          | How many simulations should be run, defaults to 1.                                       |
| <code>.distribution_type</code> | A string of either "continuous" or "discrete". The function will default to "continuous" |

**Details**

This function takes in a single argument of `.x` a vector

**Value**

A tibble

**Author(s)**

Steven P. Sanderson II, MPH

**Examples**

```
x <- mtcars$mpg
tidy_empirical(.x = x, .distribution_type = "continuous")
tidy_empirical(.x = x, .num_sims = 10, .distribution_type = "continuous")
```

---

tidy\_exponential

*Tidy Randomly Generated Exponential Distribution Tibble*

---

**Description**

This function will generate  $n$  random points from a exponential distribution with a user provided, `.rate`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the  $n$  randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the `stats::density()` function.
- `dy` The  $y$  value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_exponential(.n = 50, .rate = 1, .num_sims = 1)
```

**Arguments**

|                        |  |
|------------------------|--|
| <code>.n</code>        | The number of randomly generated points you want.      |
| <code>.rate</code>     | A vector of rates                                      |
| <code>.num_sims</code> | The number of randomly generated simulations you want. |

**Details**

This function uses the underlying `stats::rexp()`, and its underlying `p`, `d`, and `q` functions. For more information please see `stats::rexp()`

**Value**

A tibble of randomly generated data.

**Author(s)**

Steven P. Sanderson II, MPH

---

tidy\_f

*Tidy Randomly Generated F Distribution Tibble*

---

**Description**

This function will generate `n` random points from a `rf` distribution with a user provided, `df1`, `df2`, and `ncp`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of `n` for the current simulation.
- `y` The randomly generated data point.
- `dx` The `x` value from the `stats::density()` function.
- `dy` The `y` value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_f(.n = 50, .df1 = 1, .df2 = 1, .ncp = 0, .num_sims = 1)
```

**Arguments**

|                        |  |
|------------------------|--|
| <code>.n</code>        | The number of randomly generated points you want.      |
| <code>.df1</code>      | Degrees of freedom, Inf is allowed.                    |
| <code>.df2</code>      | Degrees of freedom, Inf is allowed.                    |
| <code>.ncp</code>      | Non-centrality parameter.                              |
| <code>.num_sims</code> | The number of randomly generated simulations you want. |

**Details**

This function uses the underlying `stats::rf()`, and its underlying p, d, and q functions. For more information please see [stats::rf\(\)](#)

**Value**

A tibble of randomly generated data.

tidy\_four\_autoplot      *Automatic Plot of Density Data*

---

### Description

This is an auto plotting function that will take in a `tidy_` distribution function and a few arguments, one being the plot type, which is a quoted string of one of the following:

- `density`
- `quantile`
- `probablity`
- `qq`

If the number of simulations exceeds 9 then the legend will not print. The plot subtitle is put together by the attributes of the table passed to the function.

### Usage

```
tidy_four_autoplot(
  .data,
  .line_size = 0.5,
  .geom_point = FALSE,
  .point_size = 1,
  .geom_rug = FALSE,
  .geom_smooth = FALSE,
  .geom_jitter = FALSE,
  .interactive = FALSE
)
```

### Arguments

|                           |  |
|---------------------------|--|
| <code>.data</code>        | The data passed in from a <code>tidy_distribution</code> function like <code>tidy_normal()</code>  |
| <code>.line_size</code>   | The size param <code>ggplot</code>   |
| <code>.geom_point</code>  | A Boolean value of <code>TRUE/FALSE</code> , <code>FALSE</code> is the default. <code>TRUE</code> will return a plot with <code>ggplot2::geom_point()</code>   |
| <code>.point_size</code>  | The point size param for <code>ggplot</code>   |
| <code>.geom_rug</code>    | A Boolean value of <code>TRUE/FALSE</code> , <code>FALSE</code> is the default. <code>TRUE</code> will return the use of <code>ggplot2::geom_rug()</code>  |
| <code>.geom_smooth</code> | A Boolean value of <code>TRUE/FALSE</code> , <code>FALSE</code> is the default. <code>TRUE</code> will return the use of <code>ggplot2::geom_smooth()</code> The <code>aes</code> parameter of <code>group</code> is set to <code>FALSE</code> . This ensures a single smoothing band returned with <code>SE</code> also set to <code>FALSE</code> . Color is set to <code>'black'</code> and <code>linetype</code> is <code>'dashed'</code> . |
| <code>.geom_jitter</code> | A Boolean value of <code>TRUE/FALSE</code> , <code>FALSE</code> is the default. <code>TRUE</code> will return the use of <code>ggplot2::geom_jitter()</code>   |
| <code>.interactive</code> | A Boolean value of <code>TRUE/FALSE</code> , <code>FALSE</code> is the default. <code>TRUE</code> will return an interactive <code>plotly</code> plot.   |

**Details**

This function will spit out one of the following plots:

- density
- quantile
- probability
- qq

**Value**

A ggplot or a plotly plot.

tidy\_gamma

*Tidy Randomly Generated Gamma Distribution Tibble*

---

**Description**

This function will generate n random points from a gamma distribution with a user provided, `.shape`, `.scale`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the x column which corresponds to the n randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of n for the current simulation.
- `y` The randomly generated data point.
- `dx` The x value from the `stats::density()` function.
- `dy` The y value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_gamma(.n = 50, .shape = 1, .scale = 0.3, .num_sims = 1)
```

**Arguments**

|                        |   |
|------------------------|---|
| <code>.n</code>        | The number of randomly generated points you want.   |
| <code>.shape</code>    | This is strictly 0 to infinity.   |
| <code>.scale</code>    | The standard deviation of the randomly generated data. This is strictly from 0 to infinity. |
| <code>.num_sims</code> | The number of randomly generated simulations you want.                                      |

**Details**

This function uses the underlying `stats::rgamma()`, and its underlying `p`, `d`, and `q` functions. For more information please see [stats::rgamma\(\)](#)

**Value**

A tibble of randomly generated data.

tidy\_generalized\_beta *Tidy Randomly Generated Generalized Beta Distribution Tibble*

---

## Description

This function will generate  $n$  random points from a generalized beta distribution with a user provided, `.shape1`, `.shape2`, `.shape3`, `.rate`, and/or `.scale`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the  $n$  randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the `stats::density()` function.
- `dy` The  $y$  value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

## Usage

```
tidy_generalized_beta(
  .n = 50,
  .shape1 = 1,
  .shape2 = 1,
  .shape3 = 1,
  .rate = 1,
  .scale = 1/.rate,
  .num_sims = 1
)
```

## Arguments

|                        |  |
|------------------------|--|
| <code>.n</code>        | The number of randomly generated points you want.                |
| <code>.shape1</code>   | A non-negative parameter of the Beta distribution.               |
| <code>.shape2</code>   | A non-negative parameter of the Beta distribution.               |
| <code>.shape3</code>   | A non-negative parameter of the Beta distribution.               |
| <code>.rate</code>     | An alternative way to specify the <code>.scale</code> parameter. |
| <code>.scale</code>    | Must be strictly positive.                                       |
| <code>.num_sims</code> | The number of randomly generated simulations you want.           |

**Details**

This function uses the underlying `stats::rbeta()`, and its underlying p, d, and q functions. For more information please see [stats::rbeta\(\)](#)

**Value**

A tibble of randomly generated data.

*Tidy Randomly Generated Generalized Pareto Distribution Tibble*

---

**Description**

This function will generate n random points from a generalized Pareto distribution with a user provided, `.shape1`, `.shape2`, `.rate` or `.scale` and number of #' random simulations to be produced. The function returns a tibble with the simulation number column the x column which corresponds to the n randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of n for the current simulation.
- `y` The randomly generated data point.

- dx The x value from the `stats::density()` function.
- dy The y value from the `stats::density()` function.
- p The values from the resulting `p_` function of the distribution family.
- q The values from the resulting `q_` function of the distribution family.

### Usage

```
tidy_generalized_pareto(
  .n = 50,
  .shape1 = 1,
  .shape2 = 1,
  .rate = 1,
  .scale = 1/.rate,
  .num_sims = 1
)
```

### Arguments

|                        |  |
|------------------------|--|
| <code>.n</code>        | The number of randomly generated points you want.              |
| <code>.shape1</code>   | Must be positive.  |
| <code>.shape2</code>   | Must be positive.  |
| <code>.rate</code>     | An alternative way to specify the <code>.scale</code> argument |
| <code>.scale</code>    | Must be positive.  |
| <code>.num_sims</code> | The number of randomly generated simulations you want.         |

### Details

This function uses the underlying `actuar::rgenpareto()`, and its underlying `p`, `d`, and `q` functions. For more information please see [actuar::rgenpareto\(\)](#)

### Value

A tibble of randomly generated data.

*Tidy Randomly Generated Geometric Distribution Tibble*

---

## Description

This function will generate  $n$  random points from a geometric distribution with a user provided, `.prob`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the  $n$  randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the `stats::density()` function.
- `dy` The  $y$  value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

## Usage

```
tidy_geometric(.n = 50, .prob = 1, .num_sims = 1)
```

## Arguments

|                        |   |
|------------------------|---|
| <code>.n</code>        | The number of randomly generated points you want.                 |
| <code>.prob</code>     | A probability of success in each trial $0 < \text{prob} \leq 1$ . |
| <code>.num_sims</code> | The number of randomly generated simulations you want.            |

## Details

This function uses the underlying `stats::rgeom()`, and its underlying `p`, `d`, and `q` functions. For more information please see [stats::rgeom\(\)](#)

## Value

A tibble of randomly generated data.

tidy\_hypergeometric     *Tidy Randomly Generated Hypergeometric Distribution Tibble*

---

**Description**

This function will generate  $n$  random points from a hypergeometric distribution with a user provided,  $m$ ,  $nn$ , and  $k$ , and number of random simulations to be produced. The function returns a tibble with the simulation number column the  $x$  column which corresponds to the  $n$  randomly generated points, the  $d_*$ ,  $p_*$  and  $q_*$  data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the `stats::density()` function.
- `dy` The  $y$  value from the `stats::density()` function.
- `p` The values from the resulting  $p_*$  function of the distribution family.
- `q` The values from the resulting  $q_*$  function of the distribution family.

**Usage**

```
tidy_hypergeometric(.n = 50, .m = 0, .nn = 0, .k = 0, .num_sims = 1)
```

**Arguments**

|                        |  |
|------------------------|--|
| <code>.n</code>        | The number of randomly generated points you want.      |
| <code>.m</code>        | The number of white balls in the urn                   |
| <code>.nn</code>       | The number of black balls in the urn                   |
| <code>.k</code>        | The number of balls drawn fro the urn.                 |
| <code>.num_sims</code> | The number of randomly generated simulations you want. |

**Details**

This function uses the underlying `stats::rhyper()`, and its underlying `p`, `d`, and `q` functions. For more information please see [stats::rhyper\(\)](#)

**Value**

A tibble of randomly generated data.

|--------------------------------|---|
| <code>tidy_inverse_burr</code> | <i>Tidy Randomly Generated Inverse Burr Distribution Tibble</i> |
|--------------------------------|---|

---

**Description**

This function will generate `n` random points from an Inverse Burr distribution with a user provided, `.shape1`, `.shape2`, `.scale`, `.rate`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.

- x The current value of n for the current simulation.
- y The randomly generated data point.
- dx The x value from the `stats::density()` function.
- dy The y value from the `stats::density()` function.
- p The values from the resulting p\_ function of the distribution family.
- q The values from the resulting q\_ function of the distribution family.

### Usage

```
tidy_inverse_burr(
  .n = 50,
  .shape1 = 1,
  .shape2 = 1,
  .rate = 1,
  .scale = 1/.rate,
  .num_sims = 1
)
```

### Arguments

|                        |   |
|------------------------|---|
| <code>.n</code>        | The number of randomly generated points you want.       |
| <code>.shape1</code>   | Must be strictly positive.                              |
| <code>.shape2</code>   | Must be strictly positive.                              |
| <code>.rate</code>     | An alternative way to specify the <code>.scale</code> . |
| <code>.scale</code>    | Must be strictly positive.                              |
| <code>.num_sims</code> | The number of randomly generated simulations you want.  |

### Details

*Tidy Randomly Generated Inverse Gaussian Distribution Tibble*

---

**Description**

This function will generate  $n$  random points from an Inverse Gaussian distribution with a user provided, `.mean`, `.shape`, `.dispersion`. The function returns a tibble with the simulation number column the `x` column which corresponds to the  $n$  randomly generated points.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the `stats::density()` function.
- `dy` The  $y$  value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_inverse_normal(  
  .n = 50,  
  .mean = 1,  
  .shape = 1,  
  .dispersion = 1/.shape,  
  .num_sims = 1  
)
```

**Arguments**

|                          |   |
|--------------------------|---|
| <code>.n</code>          | The number of randomly generated points you want.       |
| <code>.mean</code>       | Must be strictly positive.                              |
| <code>.shape</code>      | Must be strictly positive.                              |
| <code>.dispersion</code> | An alternative way to specify the <code>.shape</code> . |
| <code>.num_sims</code>   | The number of randomly generated simulations you want.  |

**Details**

This function uses the underlying `actuar::rinvgauss()`. For more information please see [rinvgauss\(\)](#)

**Value**

A tibble of randomly generated data.

`tidy_inverse_pareto`     *Tidy Randomly Generated Inverse Pareto Distribution Tibble*

---

**Description**

This function will generate  $n$  random points from an inverse pareto distribution with a user provided, `.shape`, `.scale`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the  $n$  randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the [stats::density\(\)](#) function.
- `dy` The  $y$  value from the [stats::density\(\)](#) function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_inverse_pareto(.n = 50, .shape = 1, .scale = 1, .num_sims = 1)
```

**Arguments**

|                        |  |
|------------------------|--|
| <code>.n</code>        | The number of randomly generated points you want.      |
| <code>.shape</code>    | Must be positive.                                      |
| <code>.scale</code>    | Must be positive.                                      |
| <code>.num_sims</code> | The number of randomly generated simulations you want. |

**Details**

tidy\_inverse\_weibull *Tidy Randomly Generated Inverse Weibull Distribution Tibble*

---

## Description

This function will generate  $n$  random points from a weibull distribution with a user provided, `.shape`, `.scale`, `.rate`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the  $n$  randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the `stats::density()` function.
- `dy` The  $y$  value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

## Usage

```
tidy_inverse_weibull(  
  .n = 50,  
  .shape = 1,  
  .rate = 1,  
  .scale = 1/.rate,  
  .num_sims = 1  
)
```

## Arguments

|                        |   |
|------------------------|---|
| <code>.n</code>        | The number of randomly generated points you want.       |
| <code>.shape</code>    | Must be strictly positive.                              |
| <code>.rate</code>     | An alternative way to specify the <code>.scale</code> . |
| <code>.scale</code>    | Must be strictly positive.                              |
| <code>.num_sims</code> | The number of randomly generated simulations you want.  |

## Details

This function uses the underlying `actuar::rinweibull()`, and its underlying `p`, `d`, and `q` functions. For more information please see `actuar::rinweibull()`

**Value**

A tibble of randomly generated data.

|--------------------------------|-------------------------------------|
| <code>tidy_kurtosis_vec</code> | <i>Compute Kurtosis of a Vector</i> |
|--------------------------------|-------------------------------------|

---

**Description**

This function takes in a vector as it's input and will return the kurtosis of that vector. The length of this vector must be at least four numbers. The kurtosis explains the sharpness of the peak of a distribution of data.

$$\left(\frac{1}{n} * \sum(x - \mu)^4\right) / \left(\left(\frac{1}{n} * \sum(x - \mu)^2\right)^2\right)$$
**Usage**

```
tidy_kurtosis_vec(.x)
```

**Arguments**

`.x`                    A numeric vector of length four or more.

**Details**

A function to return the kurtosis of a vector.

**Value**

The kurtosis of a vector

tidy\_logistic

*Tidy Randomly Generated Logistic Distribution Tibble*

---

**Description**

This function will generate  $n$  random points from a logistic distribution with a user provided, `.location`, `.scale`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the  $n$  randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the `stats::density()` function.
- `dy` The  $y$  value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_logistic(.n = 50, .location = 0, .scale = 1, .num_sims = 1)
```

**Arguments**

|                        |  |
|------------------------|--|
| <code>.n</code>        | The number of randomly generated points you want.      |
| <code>.location</code> | The location parameter                                 |
| <code>.scale</code>    | The scale parameter                                    |
| <code>.num_sims</code> | The number of randomly generated simulations you want. |

**Details**

This function uses the underlying `stats::rlogis()`, and its underlying `p`, `d`, and `q` functions. For more information please see [stats::rlogis\(\)](#)

**Value**

A tibble of randomly generated data.

|-----------------------------|--|
| <code>tidy_lognormal</code> | <i>Tidy Randomly Generated Lognormal Distribution Tibble</i> |
|-----------------------------|--|

---

**Description**

This function will generate `n` random points from a lognormal distribution with a user provided, `.meanlog`, `.sdlog`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of `n` for the current simulation.
- `y` The randomly generated data point.
- `dx` The `x` value from the `stats::density()` function.
- `dy` The `y` value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

### Usage

```
tidy_lognormal(.n = 50, .meanlog = 0, .sdlog = 1, .num_sims = 1)
```

### Arguments

|                        |  |
|------------------------|--|
| <code>.n</code>        | The number of randomly generated points you want.                      |
| <code>.meanlog</code>  | Mean of the distribution on the log scale with default 0               |
| <code>.sdlog</code>    | Standard deviation of the distribution on the log scale with default 1 |
| <code>.num_sims</code> | The number of randomly generated simulations you want.                 |

### Details

This function uses the underlying `stats::rlnorm()`, and its underlying `p`, `d`, and `q` functions. For more information please see `stats::rlnorm()`

### Value

A tibble of randomly generated data.

tidy_lognormal()
```

---

tidy\_mixture\_density *Tidy Mixture Data*

---

### Description

Create mixture model data and resulting density and line plots.

### Usage

```
tidy_mixture_density(...)
```

### Arguments

... The random data you want to pass. Example `rnorm(50,0,1)` or something like `tidy_normal(.mean = 5, .sd = 1)`

### Details

This function allows you to make mixture model data. It allows you to produce density data and plots for data that is not strictly of one family or of one single type of distribution with a given set of parameters.

For example this function will allow you to mix say `tidy_normal(.mean = 0, .sd = 1)` and `tidy_normal(.mean = 5, .sd = 1)` or you can mix and match distributions.

The output is a list object with three components.

#### 1. Data

- `input_data` (The random data passed)
- `dist_tbl` (A tibble of the passed random data)
- `density_tbl` (A tibble of the x and y data from `stats::density()`)

#### 1. Plots

- `line_plot` - Plots the `dist_tbl`
- `dens_plot` - Plots the `density_tbl`

#### 1. Input Functions

- `input_fns` - A list of the functions and their parameters passed to the function itself

### Value

A list object

### Author(s)

Steven P. Sanderson II, MPH

## Examples

```
output <- tidy_mixture_density(rnorm(100, 0, 1), tidy_normal(.mean = 5, .sd = 1))

output$data

output$plots

output$input_fns
```

---

```
tidy_multi_dist_autoplot
```

*Automatic Plot of Multi Dist Data*

---

## Description

This is an auto plotting function that will take in a tidy\_ distribution function and a few arguments, one being the plot type, which is a quoted string of one of the following:

- density
- quantile
- probability
- qq

If the number of simulations exceeds 9 then the legend will not print. The plot subtitle is put together by the attributes of the table passed to the function.

## Usage

```
tidy_multi_dist_autoplot(
  .data,
  .plot_type = "density",
  .line_size = 0.5,
  .geom_point = FALSE,
  .point_size = 1,
  .geom_rug = FALSE,
  .geom_smooth = FALSE,
  .geom_jitter = FALSE,
  .interactive = FALSE
)
```

## Arguments

|            |  |
|------------|--|
| .data      | The data passed in from a the function tidy_multi_dist() |
| .plot_type | This is a quoted string like 'density'                   |
| .line_size | The size param ggplot                                    |

|                           |   |
|---------------------------|---|
| <code>.geom_point</code>  | A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return a plot with <code>ggplot2::ggeom_point()</code>   |
| <code>.point_size</code>  | The point size param for <code>ggplot</code>  |
| <code>.geom_rug</code>    | A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return the use of <code>ggplot2::geom_rug()</code>   |
| <code>.geom_smooth</code> | A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return the use of <code>ggplot2::geom_smooth()</code> The <code>aes</code> parameter of <code>group</code> is set to FALSE. This ensures a single smoothing band returned with <code>SE</code> also set to FALSE. Color is set to 'black' and <code>linetype</code> is 'dashed'. |
| <code>.geom_jitter</code> | A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return the use of <code>ggplot2::geom_jitter()</code>  |
| <code>.interactive</code> | A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return an interactive plotly plot.   |

### Details

This function will spit out one of the following plots:

- density
- quantile
- probability
- qq

### Value

A `ggplot` or a `plotly` plot.

### Author(s)

Steven P. Sanderson II, MPH

### See Also

```
tn <- tidy_multi_single_dist(
  .tidy_dist = "tidy_normal",
  .param_list = list(
    .n = 500,
    .mean = c(-2, 0, 2),
    .sd = 1,
    .num_sims = 5
  )
)
```

```
tn %>%  
  tidy_multi_dist_autoplot()  
  
tn %>%  
  tidy_multi_dist_autoplot(.plot_type = "qq")
```

---

tidy\_multi\_single\_dist

*Generate Multiple Tidy Distributions of a single type*

---

## Description

Generate multiple distributions of data from the same tidy\_ distribution function.

## Usage

```
tidy_multi_single_dist(.tidy_dist = NULL, .param_list = list())
```

## Arguments

|             |  |
|-------------|--|
| .tidy_dist  | The type of tidy_ distribution that you want to run. You can only choose one.  |
| .param_list | This must be a list() object of the parameters that you want to pass through to the TidyDensity tidy_ distribution function. |

## Details

Generate multiple distributions of data from the same tidy\_ distribution function. This allows you to simulate multiple distributions of the same family in order to view how shapes change with parameter changes. You can then visualize the differences however you choose.

## Value

A tibble

## Author(s)

Steven P. Sanderson II, MPH

## See Also

Other Multiple Distribution: [tidy\\_combine\\_distributions\(\)](#)

**Examples**

```
tidy_multi_single_dist(
  .tidy_dist = "tidy_normal",
  .param_list = list(
    .n = 50,
    .mean = c(-1, 0, 1),
    .sd = 1,
    .num_sims = 3
  )
)
```

---

tidy\_negative\_binomial

*Tidy Randomly Generated Negative Binomial Distribution Tibble*

---

**Description**

This function will generate  $n$  random points from a negative binomial distribution with a user provided, `.size`, `.prob`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the  $x$  column which corresponds to the  $n$  randomly generated points, the  $d_$ ,  $p_$  and  $q_$  data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the `stats::density()` function.
- `dy` The  $y$  value from the `stats::density()` function.
- `p` The values from the resulting  $p_$  function of the distribution family.
- `q` The values from the resulting  $q_$  function of the distribution family.

**Usage**

```
tidy_negative_binomial(.n = 50, .size = 1, .prob = 0.1, .num_sims = 1)
```

**Arguments**

|                        |   |
|------------------------|---|
| <code>.n</code>        | The number of randomly generated points you want.   |
| <code>.size</code>     | target for number of successful trials, or dispersion parameter (the shape parameter of the gamma mixing distribution). Must be strictly positive, need not be integer. |
| <code>.prob</code>     | Probability of success on each trial where $0 < .prob \leq 1$ .   |
| <code>.num_sims</code> | The number of randomly generated simulations you want.  |

**Details**

This function uses the underlying `stats::rnbinom()`, and its underlying `p`, `d`, and `q` functions. For more information please see `stats::rnbinom()`

**Value**

A tibble of randomly generated data.

tidy\_normal

*Tidy Randomly Generated Gaussian Distribution Tibble*

---

**Description**

This function will generate `n` random points from a Gaussian distribution with a user provided, `.mean`, `.sd` - standard deviation and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `dnorm`, `pnorm` and `qnorm` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of `n` for the current simulation.
- `y` The randomly generated data point.
- `dx` The `x` value from the `stats::density()` function.
- `dy` The `y` value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_normal(.n = 50, .mean = 0, .sd = 1, .num_sims = 1)
```

**Arguments**

|                        |  |
|------------------------|--|
| <code>.n</code>        | The number of randomly generated points you want.      |
| <code>.mean</code>     | The mean of the randomly generated data.               |
| <code>.sd</code>       | The standard deviation of the randomly generated data. |
| <code>.num_sims</code> | The number of randomly generated simulations you want. |

**Details**

This function uses the underlying `stats::rnorm()`, `stats::pnorm()`, and `stats::qnorm()` functions to generate data from the given parameters. For more information please see [stats::rnorm\(\)](#)

**Value**

A tibble of randomly generated data.

tidy\_paralogistic      *Tidy Randomly Generated Paralogistic Distribution Tibble*

---

### Description

This function will generate  $n$  random points from a paralogistic distribution with a user provided, `.shape`, `.rate`, `.scale` and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the  $n$  randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the `stats::density()` function.
- `dy` The  $y$  value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

### Usage

```
tidy_paralogistic(
  .n = 50,
  .shape = 1,
  .rate = 1,
  .scale = 1/.rate,
  .num_sims = 1
)
```

### Arguments

|                        |  |
|------------------------|--|
| <code>.n</code>        | The number of randomly generated points you want.      |
| <code>.shape</code>    | Must be strictly positive.                             |
| <code>.rate</code>     | An alternative way to specify the <code>.scale</code>  |
| <code>.scale</code>    | Must be strictly positive.                             |
| <code>.num_sims</code> | The number of randomly generated simulations you want. |

### Details

This function uses the underlying `actuar::rparalogis()`, and its underlying `p`, `d`, and `q` functions. For more information please see `actuar::rparalogis()`

**Value**

A tibble of randomly generated data.

tidy\_pareto

*Tidy Randomly Generated Pareto Distribution Tibble*

---

**Description**

This function will generate  $n$  random points from a pareto distribution with a user provided, `.shape`, `.scale`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the  $n$  randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the `stats::density()` function.
- `dy` The  $y$  value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_pareto(.n = 50, .shape = 10, .scale = 0.1, .num_sims = 1)
```

**Arguments**

|                        |  |
|------------------------|--|
| <code>.n</code>        | The number of randomly generated points you want.      |
| <code>.shape</code>    | Must be positive.                                      |
| <code>.scale</code>    | Must be positive.                                      |
| <code>.num_sims</code> | The number of randomly generated simulations you want. |

**Details**

This function uses the underlying `actuar::rpareto()`, and its underlying `p`, `d`, and `q` functions. For more information please see [actuar::rpareto\(\)](#)

`tidy_pareto1`*Tidy Randomly Generated Pareto Single Parameter Distribution Tibble*

---

### Description

This function will generate `n` random points from a single parameter pareto distribution with a user provided, `.shape`, `.min`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of `n` for the current simulation.
- `y` The randomly generated data point.
- `dx` The `x` value from the `stats::density()` function.
- `dy` The `y` value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

### Usage

```
tidy_pareto1(.n = 50, .shape = 1, .min = 1, .num_sims = 1)
```

### Arguments

|                        |  |
|------------------------|--|
| <code>.n</code>        | The number of randomly generated points you want.      |
| <code>.shape</code>    | Must be positive.                                      |
| <code>.min</code>      | The lower bound of the support of the distribution.    |
| <code>.num_sims</code> | The number of randomly generated simulations you want. |

### Details

This function uses the underlying `actuar::rpareto1()`, and its underlying `p`, `d`, and `q` functions. For more information please see [actuar::rpareto1\(\)](#)

### Value

A tibble of randomly generated data.

|              |  |
|--------------|--|
| tidy_poisson | <i>Tidy Randomly Generated Poisson Distribution Tibble</i> |
|--------------|--|

---

**Description**

This function will generate  $n$  random points from a Poisson distribution with a user provided, `.lambda`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the  $n$  randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of  $n$  for the current simulation.
- `y` The randomly generated data point.
- `dx` The  $x$  value from the `stats::density()` function.
- `dy` The  $y$  value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_poisson(.n = 50, .lambda = 1, .num_sims = 1)
```

**Arguments**

|                        |  |
|------------------------|--|
| <code>.n</code>        | The number of randomly generated points you want.      |
| <code>.lambda</code>   | A vector of non-negative means.                        |
| <code>.num_sims</code> | The number of randomly generated simulations you want. |

**Details**

This function uses the underlying `stats::rpois()`, and its underlying `p`, `d`, and `q` functions. For more information please see [stats::rpois\(\)](#)

**Value**

A tibble of randomly generated data.

|                  |                         |
|------------------|-------------------------|
| tidy_random_walk | <i>Tidy Random Walk</i> |
|------------------|-------------------------|

---

**Description**

Takes in the data from a `tidy_` distribution function and applies a random walk calculation of either `cum_prod` or `cum_sum` to `y`.

**Usage**

```
tidy_random_walk(  
  .data,  
  .initial_value = 0,  
  .sample = FALSE,  
  .replace = FALSE,  
  .value_type = "cum_prod"  
)
```

**Arguments**

|                             |  |
|-----------------------------|--|
| <code>.data</code>          | The data that is being passed from a <code>tidy_</code> distribution function.   |
| <code>.initial_value</code> | The default is 0, this can be set to whatever you want.  |
| <code>.sample</code>        | This is a boolean value TRUE/FALSE. The default is FALSE. If set to TRUE then the y value from the <code>tidy_</code> distribution function is sampled.  |
| <code>.replace</code>       | This is a boolean value TRUE/FALSE. The default is FALSE. If set to TRUE AND <code>.sample</code> is set to TRUE then the replace parameter of the sample function will be set to TRUE.  |
| <code>.value_type</code>    | This can take one of three different values for now. These are the following: <ul style="list-style-type: none"> <li>• "cum_prod" - This will take the cumprod of y</li> <li>• "cum_sum" - This will take the cumsum of y</li> </ul> |

**Details**

Monte Carlo simulations were first formally designed in the 1940's while developing nuclear weapons, and since have been heavily used in various fields to use randomness solve problems that are potentially deterministic in nature. In finance, Monte Carlo simulations can be a useful tool to give a sense of how assets with certain characteristics might behave in the future. While there are more complex and sophisticated financial forecasting methods such as ARIMA (Auto-Regressive Integrated Moving Average) and GARCH (Generalised Auto-Regressive Conditional Heteroskedasticity) which attempt to model not only the randomness but underlying macro factors such as seasonality and volatility clustering, Monte Carlo random walks work surprisingly well in illustrating market volatility as long as the results are not taken too seriously.

**Value**

An ungrouped tibble.

**Author(s)**

Steven P. Sanderson II, MPH

**Examples**

```
tidy_normal(.sd = .1, .num_sims = 25) %>%
  tidy_random_walk()
```

---

tidy\_random\_walk\_autoplot

*Automatic Plot of Random Walk Data*

---

**Description**

This is an auto-plotting function that will take in a `tidy_` distribution function and a few arguments with regard to the output of the visualization.

If the number of simulations exceeds 9 then the legend will not print. The plot subtitle is put together by the attributes of the table passed to the function.

**Usage**

```
tidy_random_walk_autoplot(
  .data,
  .line_size = 1,
  .geom_rug = FALSE,
  .geom_smooth = FALSE,
  .interactive = FALSE
)
```

**Arguments**

|                           |  |
|---------------------------|--|
| <code>.data</code>        | The data passed in from a <code>tidy_distribution</code> function like <code>tidy_normal()</code>  |
| <code>.line_size</code>   | The size param <code>ggplot</code>   |
| <code>.geom_rug</code>    | A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return the use of <code>ggplot2::geom_rug()</code>  |
| <code>.geom_smooth</code> | A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return the use of <code>ggplot2::geom_smooth()</code> The <code>aes</code> parameter of <code>group</code> is set to FALSE. This ensures a single smoothing band returned with SE also set to FALSE. Color is set to 'black' and <code>linetype</code> is 'dashed'. |
| <code>.interactive</code> | A Boolean value of TRUE/FALSE, FALSE is the default. TRUE will return an interactive plotly plot.  |

**Details**

This function will produce a simple random walk plot from a `tidy_` distribution function.

**Value**

A `ggplot` or a `plotly` plot.

```

---

tidy\_range\_statistic *Get the range statistic*

---

**Description**

Takes in a numeric vector and returns back the range of that vector

**Usage**

```
tidy_range_statistic(.x)
```

**Arguments**

.x                    A numeric vector

**Details**

Takes in a numeric vector and returns the range of that vector using the diff and range functions.

**Value**

A single number, the range statistic

**Author(s)**

Steven P. Sandeson II, MPH

**See Also**

Other Statistic: [ci\\_hi\(\)](#), [ci\\_lo\(\)](#), [tidy\\_kurtosis\\_vec\(\)](#), [tidy\\_skewness\\_vec\(\)](#), [tidy\\_stat\\_tbl\(\)](#)

```

---

`tidy_scale_zero_one_vec`*Vector Function Scale to Zero and One*

---

**Description**

Takes a numeric vector and will return a vector that has been scaled from  $[0, 1]$

**Usage**

```
tidy_scale_zero_one_vec(.x)
```

**Arguments**

`.x` A numeric vector to be scaled from  $[0, 1]$  inclusive.

**Details**

Takes a numeric vector and will return a vector that has been scaled from  $[0, 1]$  The input vector must be numeric. The computation is fairly straightforward. This may be helpful when trying to compare the distributions of data where a distribution like beta which requires data to be between 0 and 1

$$y[h] = (x - \min(x)) / (\max(x) - \min(x))$$

**Value**

A numeric vector

**Author(s)**

Steven P. Sanderson II, MPH

dens_2 <- density(vec_2)
max_x <- max(dens_1$x, dens_2$x)
max_y <- max(dens_1$y, dens_2$y)
plot(dens_1,
```

```

    asp = max_y / max_x, main = "Density vec_1 (Red) and vec_2 (Blue)",
    col = "red", xlab = "", ylab = "Density of Vec 1 and Vec 2"
  )
  lines(dens_2, col = "blue")

```

---

tidy\_skewness\_vec      *Compute Skewness of a Vector*

---

### Description

This function takes in a vector as it's input and will return the skewness of that vector. The length of this vector must be at least four numbers. The skewness explains the 'tailedness' of the distribution of data.

$$\frac{((1/n) * \sum(x - \mu)^3)}{(((1/n) * \sum(x - \mu)^2)^{3/2})}$$

### Usage

```
tidy_skewness_vec(.x)
```

### Arguments

.x                    A numeric vector of length four or more.

### Details

A function to return the skewness of a vector.

### Value

The skewness of a vector

### Author(s)

Steven P. Sanderson II, MPH

### See Also

<https://en.wikipedia.org/wiki/Skewness>

Other Statistic: [ci\\_hi\(\)](#), [ci\\_lo\(\)](#), [tidy\\_kurtosis\\_vec\(\)](#), [tidy\\_range\\_statistic\(\)](#), [tidy\\_stat\\_tbl\(\)](#)

### Examples

```
tidy_skewness_vec(rnorm(100, 3, 2))
```

tidy\_stat\_tbl

*Tidy Stats of Tidy Distribution***Description**

A function to return the stat function values of a given tidy\_ distribution output.

**Usage**

```
tidy_stat_tbl(
  .data,
  .x = y,
  .fns,
  .return_type = "vector",
  .use_data_table = FALSE,
  ...
)
```

**Arguments**

|                              |   |
|------------------------------|---|
| <code>.data</code>           | The input data coming from a tidy_ distribution function.   |
| <code>.x</code>              | The default is <code>y</code> but can be one of the other columns from the input data.  |
| <code>.fns</code>            | The default is <code>IQR</code> , but this can be any stat function like <code>quantile</code> or <code>median</code> etc.  |
| <code>.return_type</code>    | The default is "vector" which returns an <code>sapply</code> object.  |
| <code>.use_data_table</code> | The default is <code>FALSE</code> , <code>TRUE</code> will use <code>data.table</code> under the hood and still return a tibble. If this argument is set to <code>TRUE</code> then the <code>.return_type</code> parameter will be ignored. |
| <code>...</code>             | Addition function arguments to be supplied to the parameters of <code>.fns</code>   |

**Details**

A function to return the value(s) of a given tidy\_ distribution function output and chosen column from it. This function will only work with tidy\_ distribution functions.

There are currently three different output types for this function. These are:

- "vector" - which gives an `sapply()` output
- "list" - which gives an `lapply()` output, and
- "tibble" - which returns a tibble in long format.

Currently you can pass any stat function that performs an operation on a vector input. This means you can pass things like `IQR`, `quantile` and their associated arguments in the `...` portion of the function.

This function also by default will rename the value column of the tibble to the name of the function. This function will also give the column name of sim\_number for the tibble output with the corresponding simulation numbers as the values.

For the sapply and lapply outputs the column names will also give the simulation number information by making column names like sim\_number\_1 etc.

There is an option of .use\_data\_table which can greatly enhance the speed of the calculations performed if used while still returning a tibble. The calculations are performed after turning the input data into a data.table object, performing the necessary calculation and then converting back to a tibble object.

### Value

A return of object of either sapply lapply or tibble based upon user input.

### Author(s)

Steven P. Sanderson II, MPH

### See Also

Other Statistic: [ci\\_hi\(\)](#), [ci\\_lo\(\)](#), [tidy\\_kurtosis\\_vec\(\)](#), [tidy\\_range\\_statistic\(\)](#), [tidy\\_skewness\\_vec\(\)](#)

### Examples

```
tn <- tidy_normal(.num_sims = 3)

p <- c(0.025, 0.25, 0.5, 0.75, 0.95)

tidy_stat_tbl(tn, y, quantile, "vector", probs = p, na.rm = TRUE)
tidy_stat_tbl(tn, y, quantile, "list", probs = p)
tidy_stat_tbl(tn, y, quantile, "tibble", probs = p)
tidy_stat_tbl(tn, y, quantile, .use_data_table = TRUE, probs = p, na.rm = TRUE)
```

---

tidy\_t

*Tidy Randomly Generated T Distribution Tibble*

---

### Description

This function will generate n random points from a rt distribution with a user provided, df, ncp, and number of random simulations to be produced. The function returns a tibble with the simulation number column the x column which corresponds to the n randomly generated points, the d\_, p\_ and q\_ data points as well.

The data is returned un-grouped.

The columns that are output are:

- sim\_number The current simulation number.

- x The current value of n for the current simulation.
- y The randomly generated data point.
- dx The x value from the `stats::density()` function.
- dy The y value from the `stats::density()` function.
- p The values from the resulting p\_ function of the distribution family.
- q The values from the resulting q\_ function of the distribution family.

### Usage

```
tidy_t(.n = 50, .df = 1, .ncp = 0, .num_sims = 1)
```

### Arguments

|                        |  |
|------------------------|--|
| <code>.n</code>        | The number of randomly generated points you want.      |
| <code>.df</code>       | Degrees of freedom, Inf is allowed.                    |
| <code>.ncp</code>      | Non-centrality parameter.                              |
| <code>.num_sims</code> | The number of randomly generated simulations you want. |

### Details

This function uses the underlying `stats::rt()`, and its underlying p, d, and q functions. For more information please see `stats::rt()`

### Value

A tibble of randomly generated data.

### Author(s)

`tidy_uniform`*Tidy Randomly Generated Uniform Distribution Tibble*

---

## Description

This function will generate `n` random points from a uniform distribution with a user provided, `.min` and `.max` values, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of `n` for the current simulation.
- `y` The randomly generated data point.
- `dx` The `x` value from the `stats::density()` function.
- `dy` The `y` value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

## Usage

```
tidy_uniform(.n = 50, .min = 0, .max = 1, .num_sims = 1)
```

## Arguments

|                        |  |
|------------------------|--|
| <code>.n</code>        | The number of randomly generated points you want.      |
| <code>.min</code>      | A lower limit of the distribution.                     |
| <code>.max</code>      | An upper limit of the distribution                     |
| <code>.num_sims</code> | The number of randomly generated simulations you want. |

## Details

This function uses the underlying `stats::runif()`, and its underlying `p`, `d`, and `q` functions. For more information please see `stats::runif()`

## Value

A tibble of randomly generated data.

tidy\_weibull

*Tidy Randomly Generated Weibull Distribution Tibble*

---

**Description**

This function will generate `n` random points from a weibull distribution with a user provided, `.shape`, `.scale`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.
- `x` The current value of `n` for the current simulation.
- `y` The randomly generated data point.
- `dx` The `x` value from the `stats::density()` function.
- `dy` The `y` value from the `stats::density()` function.
- `p` The values from the resulting `p_` function of the distribution family.
- `q` The values from the resulting `q_` function of the distribution family.

**Usage**

```
tidy_weibull(.n = 50, .shape = 1, .scale = 1, .num_sims = 1)
```

**Arguments**

|                        |  |
|------------------------|--|
| <code>.n</code>        | The number of randomly generated points you want.      |
| <code>.shape</code>    | Shape parameter defaults to 0.                         |
| <code>.scale</code>    | Scale parameter defaults to 1.                         |
| <code>.num_sims</code> | The number of randomly generated simulations you want. |

**Details**

This function uses the underlying `stats::rweibull()`, and its underlying `p`, `d`, and `q` functions. For more information please see `stats::rweibull()`

**Value**

*Tidy Randomly Generated Zero Truncated Poisson Distribution Tibble*

---

**Description**

This function will generate `n` random points from a Zero Truncated Poisson distribution with a user provided, `.lambda`, and number of random simulations to be produced. The function returns a tibble with the simulation number column the `x` column which corresponds to the `n` randomly generated points, the `d_`, `p_` and `q_` data points as well.

The data is returned un-grouped.

The columns that are output are:

- `sim_number` The current simulation number.

- x The current value of n for the current simulation.
- y The randomly generated data point.
- dx The x value from the `stats::density()` function.
- dy The y value from the `stats::density()` function.
- p The values from the resulting `p_` function of the distribution family.
- q The values from the resulting `q_` function of the distribution family.

### Usage

```
tidy_zero_truncated_poisson(.n = 50, .lambda = 1, .num_sims = 1)
```

### Arguments

|                        |  |
|------------------------|--|
| <code>.n</code>        | The number of randomly generated points you want.      |
| <code>.lambda</code>   | A vector of non-negative means.                        |
| <code>.num_sims</code> | The number of randomly generated simulations you want. |

### Details

This function uses the underlying `actuar::rztpois()`, and its underlying `p`, `d`, and `q` functions. For more information please see `actuar::rztpois()`

---

`util_bernoulli_param_estimate`*Estimate Bernoulli Parameters*

---

## Description

This function will attempt to estimate the Bernoulli prob parameter given some vector of values `.x`. The function will return a list output by default, and if the parameter `.auto_gen_empirical` is set to `TRUE` then the empirical data given to the parameter `.x` will be run through the `tidy_empirical()` function and combined with the estimated Bernoulli data.

## Usage

```
util_bernoulli_param_estimate(.x, .auto_gen_empirical = TRUE)
```

## Arguments

`.x` The vector of data to be passed to the function. Must be non-negative integers.

`.auto_gen_empirical` This is a boolean value of `TRUE/FALSE` with default set to `TRUE`. This will automatically create the `tidy_empirical()` output for the `.x` parameter and use the `tidy_combine_distributions()`. The user can then plot out the data using `$combined_data_tbl` from the function output.

## Details

This function will see if the given vector `.x` is a numeric vector. It will attempt to estimate the prob parameter of a Bernoulli distribution.

## Value

A tibble/list

output$parameter_tbl

output$combined_data_tbl %>%
  tidy_combinedautoplot()
```

---

util\_bernoulli\_stats\_tbl

*Distribution Statistics*

---

**Description**

Returns distribution statistics in a tibble.

**Usage**

```
util_bernoulli_stats_tbl(.data)
```

**Arguments**

`.data`            The data being passed from a tidy\_ distribution function.

**Details**

This function will take in a tibble and returns the statistics of the given type of tidy\_ distribution. It is required that data be passed from a tidy\_ distribution function.

**Value**

A tibble

**Author(s)**

Steven P. Sanderson II, MPH

tidy_bernoulli() %>%
  util_bernoulli_stats_tbl() %>%
  glimpse()
```

---

```
util_beta_param_estimate
```

*Estimate Beta Parameters*

---

**Description**

This function will automatically scale the data from 0 to 1 if it is not already. This means you can pass a vector like `mtcars$mpg` and not worry about it.

The function will return a list output by default, and if the parameter `.auto_gen_empirical` is set to `TRUE` then the empirical data given to the parameter `.x` will be run through the `tidy_empirical()` function and combined with the estimated beta data.

Three different methods of shape parameters are supplied:

- Bayes
- NIST mme
- EnvStats mme, see [EnvStats::ebeta\(\)](#)

**Usage**

```
util_beta_param_estimate(.x, .auto_gen_empirical = TRUE)
```

**Arguments**

`.x` The vector of data to be passed to the function. Must be numeric, and all values must be  $0 \leq x \leq 1$

`.auto_gen_empirical` This is a boolean value of `TRUE/FALSE` with default set to `TRUE`. This will automatically create the `tidy_empirical()` output for the `.x` parameter and use the `tidy_combine_distributions()`. The user can then plot out the data using `$combined_data_tbl` from the function output.

**Details**

This function will attempt to estimate the beta shape1 and shape2 parameters given some vector of values.

**Value**

A tibble/list

```

---

util\_binomial\_param\_estimate

*Estimate Binomial Parameters*

---

## Description

This function will check to see if some given vector `.x` is either a numeric vector or a factor vector with at least two levels then it will cause an error and the function will abort. The function will return a list output by default, and if the parameter `.auto_gen_empirical` is set to `TRUE` then the empirical data given to the parameter `.x` will be run through the `tidy_empirical()` function and combined with the estimated binomial data.

**Usage**

```
util_binomial_param_estimate(.x, .size = NULL, .auto_gen_empirical = TRUE)
```

**Arguments**

`.x` The vector of data to be passed to the function. Must be numeric, and all values must be  $0 \leq x \leq 1$

`.size` Number of trials, zero or more.

`.auto_gen_empirical`  
This is a boolean value of TRUE/FALSE with default set to TRUE. This will automatically create the `tidy_empirical()` output for the `.x` parameter and use the `tidy_combine_distributions()`. The user can then plot out the data using `$combined_data_tbl` from the function output.

**Details**

This function will attempt to estimate the binomial  $p_{\hat{}}$  and size parameters given some vector of values.

**Value**

A tibble/list

---

util\_hypergeometric\_param\_estimate

*Estimate Hypergeometric Parameters*

---

**Description**

This function will attempt to estimate the geometric prob parameter given some vector of values `.x`. Estimate `m`, the number of white balls in the urn, or `m+n`, the total number of balls in the urn, for a hypergeometric distribution.

**Usage**

```
util_hypergeometric_param_estimate(
  .x,
  .m = NULL,
  .total = NULL,
  .k,
  .auto_gen_empirical = TRUE
)
```

**Arguments**

|                                  |  |
|----------------------------------|--|
| <code>.x</code>                  | A non-negative integer indicating the number of white balls out of a sample of size <code>.k</code> drawn without replacement from the urn. You cannot have missing, undefined or infinite values.   |
| <code>.m</code>                  | Non-negative integer indicating the number of white balls in the urn. You must supply <code>.m</code> or <code>.total</code> , but not both. You cannot have missing values.   |
| <code>.total</code>              | A positive integer indicating the total number of balls in the urn (i.e., $m+n$ ). You must supply <code>.m</code> or <code>.total</code> , but not both. You cannot have missing values.  |
| <code>.k</code>                  | A positive integer indicating the number of balls drawn without replacement from the urn. You cannot have missing values.  |
| <code>.auto_gen_empirical</code> | This is a boolean value of TRUE/FALSE with default set to TRUE. This will automatically create the <code>tidy_empirical()</code> output for the <code>.x</code> parameter and use the <code>tidy_combine_distributions()</code> . The user can then plot out the data using <code>\$combined_data_tbl</code> from the function output. |

**Details**

This function will see if the given vector `.x` is a numeric integer. It will attempt to estimate the prob parameter of a geometric distribution. Missing (NA), undefined (NaN), and infinite (Inf, -Inf) values are not allowed. Let `.x` be an observation from a hypergeometric distribution with parameters `.m` = M, `.n` = N, and `.k` = K. In R nomenclature, `.x` represents the number of white balls drawn out of a sample of `.k` balls drawn without replacement from an urn containing `.m` white balls and `.n` black balls. The total number of balls in the urn is thus `.m + .n`. Denote the total number of balls by  $T = .m + .n$

**Value**

A tibble/list

---

util\_logistic\_param\_estimate

*Estimate Logistic Parameters*

---

**Description**

The function will return a list output by default, and if the parameter `.auto_gen_empirical` is set to TRUE then the empirical data given to the parameter `.x` will be run through the `tidy_empirical()` function and combined with the estimated logistic data.

Three different methods of shape parameters are supplied:

- MLE
- MME
- MMUE

**Usage**

```
util_logistic_param_estimate(.x, .auto_gen_empirical = TRUE)
```

**Arguments**

`.x` The vector of data to be passed to the function.

`.auto_gen_empirical`

This is a boolean value of TRUE/FALSE with default set to TRUE. This will automatically create the `tidy_empirical()` output for the `.x` parameter and use the `tidy_combine_distributions()`. The user can then plot out the data using `$combined_data_tbl` from the function output.

**Details**

This function will attempt to estimate the logistic location and scale parameters given some vector of values.

`.data` The data being passed from a `tidy_` distribution function.

### Details

This function will take in a tibble and returns the statistics of the given type of `tidy_` distribution. It is required that data be passed from a `tidy_` distribution function.

### Value

A tibble

### Author(s)

Steven P. Sanderson II, MPH

**Examples**

```
library(dplyr)

tidy_pareto() %>%
  util_pareto_stats_tbl() %>%
  glimpse()
```

---

```
util_poisson_param_estimate
      Estimate Poisson Parameters
```

---

**Description**

The function will return a list output by default, and if the parameter `.auto_gen_empirical` is set to `TRUE` then the empirical data given to the parameter `.x` will be run through the `tidy_empirical()` function and combined with the estimated poisson data.

**Usage**

```
util_poisson_param_estimate(.x, .auto_gen_empirical = TRUE)
```

**Arguments**

`.x` The vector of data to be passed to the function.

`.auto_gen_empirical` This is a boolean value of `TRUE/FALSE` with default set to `TRUE`. This will automatically create the `tidy_empirical()` output for the `.x` parameter and use the `tidy_combine_distributions()`. The user can then plot out the data using `$combined_data_tbl` from the function output.

**Details**

This function will attempt to estimate the pareto lambda parameter given some vector of values.

**Value**

A tibble/list

util\_uniform\_param\_estimate

*Estimate Uniform Parameters*

---

**Description**

The function will return a list output by default, and if the parameter `.auto_gen_empirical` is set to `TRUE` then the empirical data given to the parameter `.x` will be run through the `tidy_empirical()` function and combined with the estimated uniform data.

**Usage**

```
util_uniform_param_estimate(.x, .auto_gen_empirical = TRUE)
```

**Arguments**

`.x` The vector of data to be passed to the function.

`.auto_gen_empirical` This is a boolean value of TRUE/FALSE with default set to TRUE. This will automatically create the `tidy_empirical()` output for the `.x` parameter and use the `tidy_combine_distributions()`. The user can then plot out the data using `$combined_data_tbl` from the function output.

**Details**

This function will attempt to estimate the uniform min and max parameters given some vector of values.

`util_weibull_param_estimate`*Estimate Weibull Parameters*

---

## Description

The function will return a list output by default, and if the parameter `.auto_gen_empirical` is set to `TRUE` then the empirical data given to the parameter `.x` will be run through the `tidy_empirical()` function and combined with the estimated weibull data.

## Usage

```
util_weibull_param_estimate(.x, .auto_gen_empirical = TRUE)
```

## Arguments

`.x` The vector of data to be passed to the function.

`.auto_gen_empirical` This is a boolean value of `TRUE/FALSE` with default set to `TRUE`. This will automatically create the `tidy_empirical()` output for the `.x` parameter and use the `tidy_combine_distributions()`. The user can then plot out the data using `$combined_data_tbl` from the function output.

## Details

This function will attempt to estimate the weibull shape and scale parameters given some vector of values.

## Value

A tibble/list
